METHOD, DEVICE AND SYSTEM FOR INVOKING LOCAL SERVICE ASSEMBLY BY BROWSER

Abstract

Provided are a method, device and system for invoking a local service assembly by a browser. The method comprises: receiving, by a client, a connection request based on a cross-domain communication protocol, which is initiated by a browser end; conducting, by the client, validity verification on the connection request; and if the connection request has passed the validity verification, establishing, by the client, a communication connection based on the cross-domain communication protocol with the browser end, for the browser end to invoke a local service assembly. The embodiment of the present application can realize invoking of a local service assembly by most popular browsers and the communication security is better.
