

**ABSTRACT**

A refuse bin made of plastic in the approximate shape of an upright cylinder comprises a hinged lid and two wheels mounted coaxially to each other in recesses (48) in the bottom portion of the refuse bin (46), connected with axle stumps (12). Inside the recesses (48) there are mounting barrels (50) which are connected in one piece with the refuse bin by means of a number of ribs (54,62). Together with the mounting barrels (50) the axle stumps (12) of the wheels form a locking mechanism to axially lock the axle stumps in place.
