

ABSTRACT

AN ANTI-EAVESDROPPING APPARATUS AND A PROCESSING METHOD ASSOCIATED THEREWITH

An apparatus which can correspond to an anti-eavesdropping apparatus is provided. The apparatus can be used for impeding eavesdropping by, for example, unauthorized individual(s) via one or more portable communication devices used by corresponding one or more users who may be participating in, for example, a confidential discussion. The apparatus can include a casing within which a portable communication device can be placed and within which babble noise can be generated. Preferably, at least a portion of the casing allows visual perception of the portable communication device when it is enclosed within the casing.
