A B S T R A C T

A server system (12) transmits display information that allows selecting a circuit module, display information that allows designating a parameter of the circuit module, and display information that allows inputting circuit specifications to a client terminal (13) through a network (11). The server system acquires circuit module selection information, designated parameter information, and circuit specification information from the client terminal (13), simulates the electrical characteristics of the circuit, and transmits the determination result to the client terminal (13). With this arrangement, a circuit that meets the client's specifications is designed.
