

## WASHING MACHINE

### ABSTRACT

A washing machine according to the present disclosure includes: a silver crystal unit (15) which stores silver crystals (29); a detergent case (9) which includes a silver  
5 crystal unit housing (16) which removably houses the silver crystal unit (15); and a water injection device (11) which supplies water to the silver crystal unit (15). With this configuration, when the remaining amount of the silver crystals (29) has become low, the silver crystal unit (15) can be replaced. Accordingly, a steady supplemental effect can be applied to the laundry. In addition, the washing operation can be performed with the  
10 silver crystal unit (15) removed as necessary.
