ABSTRACT

The present application provides an identity recognition method and apparatus, a device, a medium, and a program product, which may relate to Internet technology. The method comprises: acquiring a current biological feature of a first object; recognizing identity information of the first object on the basis of the current biological feature and respective first biological features of N objects, wherein N is a positive integer; and if the identity information of the first object has failed to be recognized on the basis of the current biological feature of the first object and the respective first biological features of the N objects, recognizing the identity information of the first object on the basis of the current biological feature of the first object and respective second biological features of the N objects. Therefore, the object experience can be improved.
