

METHOD AND APPARATUS FOR UPGRADING APPLICATION

ABSTRACT

5 The present application provides a method and an apparatus for upgrading an
application. The method includes the following: obtaining an application name of a
submitted application; triggering a predetermined disable command when the
submitted application has the same name as an existing application, to invoke an end
function of each node in the existing application; recycling a process occupied by
each node when receiving execution completion information returned by the existing
10 application; and triggering a predetermined start command when recycling is
completed, to start a process that corresponds to each node in the submitted
application. By applying implementations of the present application, an application
management module can automatically upgrade the existing application when
detecting that a user submits the application that has the same name as the existing
15 application. Because no human participation is needed, a time consumed for an
application upgrade can be reduced.
