ABSTRACT

In order to enable a reduction in the costs accompanying work related to loading cash into ATMs, this ATM-cash-loading management system (100) is provided with a configuration including: a storage device (101) for storing an ATM management table (125) in which information related to the cash holding amount in each of a plurality of ATMs (200) is stored; and a calculation device (104) which receives, from user terminals (300), scheduled notifications of ATM transactions by prescribed users, uses the ATM management table (125) to specify ATMs (200) having a cash holding amount that will change towards a prescribed reference as a result of the transactions indicated by the scheduled notifications being carried out, and transmits, to the user terminals (300), information recommending transactions using the specified ATMs (200).
