ABSTRACT

DUST COLLECTING DEVICE AND AIR-CONDITIONING APPARATUS

A dust collecting device (1) includes a housing (4) accommodating an air passage (3) that allows air to pass through the air passage (3), an unwinder (7) configured to supply, into the air passage, a film (5) conveyed along a path that crosses the air passage, a friction body (6) configured to apply friction to the film fed from the unwinder to electrically charge the film, and a winder (8) configured to wind, onto the winder (8), the film electrically charged and placed in the air passage. The dust collecting device is provided that can easily restore a collecting efficiency and requires no maintenance for a long time.
