

ABSTRACT

A transaction execution method and apparatus, a computing device and a storage medium, which relate to the technical field of databases. The method comprises: when an interrupted DDL transaction satisfies a recovery condition, determining (201) a last data block for which processing was completed prior to the interruption of the DDL transaction; beginning from the data block following the last data block, continuing to execute (202) the DDL transaction; and when processing is complete for all of the data blocks of the DDL transaction operation, submitting (203) the DDL transaction.
