ABSTRACT

REINFORCING BAR BINDING APPARATUS

This reinforcing bar binding apparatus comprises a binding part (129) for binding reinforcing bars, a holding part (112) for holding the binding part (129), and an elevating mechanism (113) that lifts and lowers the holding part (112) with respect to a body unit. The elevating mechanism (113) includes a coupling part (119) that is coupled to the holding part (112) and a drive part (127) that moves the coupling part (119). The coupling part (119) has a movable shaft (115), and the holding part (112) has a long hole (111H) engaging with the movable shaft (115). The drive part (127) moves the coupling part (119) in a state where the binding part (129) is in contact with the reinforcing bars and moves the movable shaft (115) relative to the long hole (111H) to thereby release the engagement therebetween.
