

Abstract

The present invention relates to a method for treating an at least partially metallized textile, wherein the textile is treated with at least one agent selected from the group consisting of a reducing agent and a complexing agent. Further, the present invention relates to a textile treated in such a way as well as its use for the antimicrobial treatment of liquids or the production of socks, insoles, clothing, covering textiles for seating furniture or mattresses. A textile treated with the method according to the invention enables a metal release suitable for a purpose, adjustable depending on the application field.
