ABSTRACT

"Grounding clip of the insulation displacement type"

A grounding clip (10) has a bridge portion (18) with a first and a second tine (20A, 20B) extending therefrom. The tines are subdivided by a line of demarcation (38) into first and second portions (24A, 26A, 24B, 26B) respectively defining the parts of the tine received in respective first and second housing (H1, H2) sections. Each tine has a protrusion (50A, 52A, 50B, 52B) on each portion thereof. The protrusions are sized so that the protrusions snugly contact the housing section in which they are received in an interference fit.
