ABSTRACT

DATA PROTECTING METHOD AND COMPUTING APPARATUS

A data protecting method, including the steps of: (a) upon receipt of a triggering command, configuring a hardware control module (1) to store data in a hidden zone (31) that is unidentifiable, unreadable and unwritable by an operating system block (4) in communication with the hardware control module (1); and (b) upon receipt of a restore request command (22) from an input device (2) in direct communication with the hardware control module (1), configuring the hardware control module (1) to execute the restore request command (22) so as to transfer the data from the hidden zone (31) to a working zone (32) that is identifiable, readable and writable by the operating system block (4) when a predetermined condition is satisfied.
