[0001] This application claims priority to, and the benefit of, US Provisional Patent Application No. 62/286,858, entitled MAYTANSINOID DERIVATIVES, CONJUGATES THEREOF AND METHODS OF USE, which was filed January 25, 2016. FIELD

[0002] The present disclosure concerns maytansinoid compounds, derivatives thereof, conjugates thereof, and methods of treating or preventing proliferative diseases with the same.

BACKGROUND

[0003] Proliferative diseases, for example cancer, are characterized by the uncontrolled growth of abnormal cells. Current treatments of proliferative diseases include surgery, radiation, chemotherapy, hormone-based therapy and/or immunotherapy. A number of these treatments, particularly chemotherapy, utilize anti-proliferative drugs that limit the spread of the abnormal cells. However, these drugs are typically indiscriminate in their ability to kill cells, affecting both normal and abnormal cells. To address this problem, various approaches to targeted drug delivery have been explored, including the use of conjugates of tumor-targeted probes (such as antibodies or growth factors) with toxins, to selectively target abnormal cells. Antibody drug conjugates (ADCs) are compounds composed of an antibody that is linked, via a chemical linker, to a cytotoxic agent. Such compounds leverage the antibody's binding specificity for its target to deliver a cytotoxic agent to an abnormal cell. Thus, there is a need for anti-proliferative compounds and their conjugates.

In some examples, amide synthesis conditions refer to reaction conditions suitable to effect the formation of an amide bond between a carboxylic acid and an amine. In some of these examples, the carboxylic acid is first converted to an activated carboxylic acid before the activated carboxylic acid reacts with an amine to form an amide. Suitable conditions to effect the formation of an amide include, but are not limited to, those utilizing reagents to effect the reaction between a carboxylic acid an amine, including, but not limited to, dicyclohexylcarbodiimide (DCC), diisopropylcarbodiimide (DIC), (benzotriazol-1-yloxy)tris(dimethylamino)phosphonium hexafluorophosphate (BOP), (benzotriazol-1-yloxy)tripyrrolidinophosphonium hexafluorophosphate (PyBOP), (7-azabenzotriazol-1-

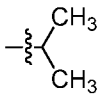

yloxy)tripyrrolidinophosphonium hexafluorophosphate (PyAOP), bromotripyrrolidinophosphonium hexafluorophosphate (PyBrOP), O-(benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HBTU), O-(benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU), 1-[Bis(dimethylamino)methylene]-1*H*-1,2,3-triazolo[4,5-*b*]pyridinium 3-oxid hexafluorophosphate (HATU), 2-Ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline (EEDQ), 1-Ethyl-3-(3-dimethylaminopropyl)carbodiimide (EDC), 2-Chloro-1,3-dimethylimidazolidinium hexafluorophosphate (CIP), 2-chloro-4,6-dimethoxy-1,3,5-triazine (CDMT), and carbonyldiimidazole (CDI). In some examples, a carboxylic acid is first converted to an activated carboxylic ester before reacting with an amine to form an amide bond. In certain embodiments, the carboxylic acid is reacted with a reagent. The reagent activates the carboxylic acid by deprotonating the carboxylic acid and then forming a product complex with the deprotonated carboxylic acid as a result of nucleophilic attack by the deprotonated carboxylic acid onto the protonated reagent. For certain carboxylic acids, this activated ester is more susceptible subsequently to nucleophilic attack by an amine than the carboxylic acid is before it is converted into an activated ester. This results in amide bond formation. As such, the carboxylic acid is described as activated. Exemplary reagents include DCC and DIC.

D. PREPARATION OF COMPOUNDS

[0301] Compounds of Formula I can be synthesized by coupling compounds of Formula P1 with a binding agent, *e.g.*, antibody under standard conjugation conditions (*see*, *e.g.*, Doronina *et al., Nature Biotechnology* 2003, 21, 7, 778, which is incorporated herein by reference). Compounds of formula P1 containing a reactive moiety, *e.g.*, activated ester or acid halide group, can be coupled to lysine residues. Suitable solvents include, but are not limited to water, DMA, DMF, and DMSO. [0429] In some embodiments of the methods described herein, multiple doses of a compound described herein (or a pharmaceutical composition comprising a combination of an

compound described herein and any of the additional therapeutic agents mentioned herein) may be administered to a subject over a defined time course. The methods according to this aspect of the disclosure comprise sequentially administering to a subject multiple doses of a compound described herein. As used herein, "sequentially administering" means that each dose of the compound is administered to the subject at a different point in time, *e.g.*, on different days separated by a predetermined interval (*e.g.*, hours, days, weeks or months). The present disclosure includes methods which comprise sequentially administering to the patient a single initial dose of a compound described herein, followed by one or more secondary doses of the compound, and optionally followed by one or more tertiary doses of the compound.

[0430] The terms "initial dose," "secondary doses," and "tertiary doses," refer to the temporal sequence of administration of the compounds described herein. Thus, the "initial dose" is the dose which is administered at the beginning of the treatment regimen (also referred to as the "baseline dose"); the "secondary doses" are the doses which are administered after the initial dose; and the "tertiary doses" are the doses which are administered after the secondary doses. The initial, secondary, and tertiary doses can all contain the same amount the compound described herein, but generally can differ from one another in terms of frequency of administration. In certain embodiments, the amount of the compound contained in the initial, secondary and/or tertiary doses varies from one another (*e.g.*, adjusted up or down as appropriate) during the course of treatment. In certain embodiments, two or more (*e.g.*, 2, 3, 4, or 5) doses are administered at the beginning of the treatment regimen as "loading doses" followed by subsequent doses that are administered on a less frequent basis (*e.g.*, "maintenance doses").

[0431] In certain exemplary embodiments of the present disclosure, each secondary and/or tertiary dose is administered 1 to 26 (*e.g.*, 1, 1½, 2, 2½, 3, 3½, 4, 4½, 5, 5½, 6, 6½, 7, 7½, 8, 8½, 9, 9½, 10, 10½, 11, 11½, 12, 12½, 13, 13½, 14, 14½, 15, 15½, 16, 16½, 17, 17½, 18, 18½, 19, 19½, 20, 20½, 21, 21½, 22, 22½, 23, 23½, 24, 24½, 25, 25½, 26, 26½, or more) weeks after the immediately preceding dose. The phrase "the immediately preceding dose," as used herein, means, in a sequence of multiple administrations, the dose the compound which is administered to a patient prior to the administration of the very next dose in the sequence with no intervening doses.

[0432] The methods according to this aspect of the disclosure may comprise administering to a patient any number of secondary and/or tertiary doses of the compound. For example, in certain embodiments, only a single secondary dose is administered to the patient. In other embodiments, two or more (*e.g.*, 2, 3, 4, 5, 6, 7, 8, or more) secondary doses are administered to the patient. Likewise, in certain embodiments, only a single tertiary dose is administered to the patient. In other embodiments, two or more (*e.g.*, 2, 3, 4, 5, 6, 7, 8, or more) tertiary doses are administered to the patient. The administration regimen may be carried out indefinitely over the lifetime of a particular subject, or until such treatment is no longer therapeutically needed or advantageous.

[0433] In embodiments involving multiple secondary doses, each secondary dose may be administered at the same frequency as the other secondary doses. For example, each secondary dose may be administered to the patient 1 to 2 weeks or 1 to 2 months after the immediately preceding dose. Similarly, in embodiments involving multiple tertiary doses, each tertiary dose may be administered at the same frequency as the other tertiary doses. For example, each tertiary dose may be administered to the patient 2 to 12 weeks after the immediately preceding dose. In certain embodiments of the disclosure, the frequency at which the secondary and/or tertiary doses are administered to a patient can vary over the course of the treatment regimen. The frequency of administration may also be adjusted during the course of treatment by a physician depending on the needs of the individual patient following clinical examination.

[0434] The present disclosure includes administration regimens in which 2 to 6 loading doses are administered to a patient at a first frequency (*e.g.*, once a week, once every two weeks, once every three weeks, once a month, once every two months, etc.), followed by administration of two or more maintenance doses to the patient on a less frequent basis. For example, according to this aspect of the disclosure, if the loading doses are administered at a frequency of once a month, then the maintenance doses may be administered to the patient once every six weeks, once every two months, once every three months, *etc*.

[0435] The present disclosure includes pharmaceutical compositions of the compounds and/or conjugates described herein, *e.g.*, the compounds of Formula (I) and (II), *e.g.*, compositions comprising a compound described herein, a salt, stereoisomer, polymorph thereof, and a pharmaceutically acceptable carrier, diluent, and/or excipient. Examples of suitable carriers, diluents and excipients include, but are not limited to: buffers for maintenance of proper

composition pH (*e.g.*, citrate buffers, succinate buffers, acetate buffers, phosphate buffers, lactate buffers, oxalate buffers and the like), carrier proteins (*e.g.*, human serum albumin), saline, polyols (*e.g.*, trehalose, sucrose, xylitol, sorbitol, and the like), surfactants (*e.g.*, polysorbate 20, polysorbate 80, polyoxolate, and the like), antimicrobials, and antioxidants.

EXAMPLE 1

[0437] Example 1 refers to compounds illustrated in FIG. 9.

Maytan-3-O-carbamoyl-N-phenyl-p-(amino-Cit-Val-Cap-Mal) (**9**)

Step A: L-valine-L-citrulline (**2**):

[0438] To a 50 mL round bottom flask equipped with a magnetic stirrer and nitrogen inlet was charged Boc-L-valine-L-citrulline (**1**, 0.5 g; 1.3 mmol), acetonitrile (10 mL) and water (10 mL). An aqueous solution of 1 M HCl (13 mL; 13 mmol) was added and this solution was stirred at ambient temperature for 18 hours (h). The solution was frozen and lyophilized to a white solid. The solid was extracted with 10% MeOH in DCM, the organic layer was dried over Na_2SO_4, filtered and concentrated to afford the title compound (0.4 g, 98% yield) as a clear colorless oil. MS (ESI, pos. & neg.): calc'd for $C_{11}H_{22}N_4O_4$, 274.2; found 275.2 (M+H), 273.2 (M-H).

Step B: 6-Maleimidyl-caproamidyl-L-valine-L-citrulline (**4**):

[0439] To a 25 mL round bottom flask equipped with a magnetic stirrer and nitrogen inlet was charged L-valine-L-citrulline (**2**, 0.4 g; 1.3 mmol), 6-maleimido-caproic acid succinate ester (**3**, 0.6 g; 2.0 mmol) in DMF (3 mL) followed by DIEA (0.4 mL; 2.0 mmol). The solution was stirred at ambient temperature for 18 hours, diluted with water (2 mL) and loaded onto a C18 column eluting with 5-95% MeCN in water (containing 0.05% HOAc). The fractions containing product were combined, frozen and lyophilized to afford the title compound (0.3 g, 47% yield) as a white solid. MS (ESI, pos. & neg.): calc'd for $C_{21}H_{33}N_5O_7$, 467.2; found 468.4 (M+H), 466.4 (M-H).

Step C: Maytan-3-O-carbamoyl-N-(4-nitrobenzene) (**7**):

[0440] To a dry round bottom flask was weighed maytansinol (**6**) (prepared as previously described in the art, 114 mg, 0.202 mmol) and p-nitrophenyl isocyanate (**5**, 73 mg, 0.445 mmol). The mixture was dissolved in dry DCM (10 mL) and treated dropwise with a 1.0 M solution of zinc chloride in diethyl ether (0.50 mL, 0.50 mmol). The flask was sealed with a rubber septum, purged with argon via needle, and the reaction stirred at ambient temperature for 18 h. LCMS showed complete conversion of the maytansinol. The reaction was diluted with water and

extracted three times with EtOAc. The combined organic layers were washed with saturated aqueous (aq.) $NaHCO_3$ and brine, dried over Na_2SO_4, and filtered. The evaporated product was not very soluble in MeCN/water, so it was concentrated to dryness again *in vacuo*, dissolved in EtOAc/DCM, and filtered over Na_2SO_4. The filtrate was then purified by flash chromatography on silica gel (gradient elution: 50 – 100% EtOAc in hexanes) and the fractions containing product were combined, concentrated, and dried *in vacuo* giving the title compound as a yellow solid (50 mg, 34%). MS (ESI, pos.): calc'd for $C_{35}H_{41}N_4O_{11}Cl$, 728.3; found 729.2 (M+H).

Step D: Maytan-3-O-carbamoyl-N-(4-aminobenzene) (**8**):

[0441] The product of the preceding step (**7**, 49 mg, 0.067 mmol) and zinc dust (85 mg, 1.30 mmol) were weighed into a round bottom flask and treated with THF (4 mL), water (1 mL), and HOAc (0.100 mL, 1.75 mmol). The flask was sealed with a rubber septum, purged with argon, and the reaction stirred at ambient temperature for 18 h. The reaction was filtered over Celite, solids rinsed with acetonitrile (MeCN, 3 x 5 mL), and the filtrate concentrated *in vacuo* to an amber oil. This was purified directly on a C18 Aq RediSep Gold column via ISCO (gradient elution: 20 – 80% MeCN in water, 0.05% acetic acid in both, over 12 min). The fractions containing product were combined, partially concentrated *in vacuo*, frozen on dry ice, and lyophilized for 3 days (d) giving the title compound as a cream-colored solid (32 mg, 63%). MS (ESI, pos.): calc'd for $C_{35}H_{43}N_4O_9Cl$, 698.3; found 699.2 (M+H).

Step E: Maytan-3-O-carbamoyl-N-phenyl-p-(amino-Cit-Val-Cap-Mal) (**9**):

[0442] The product of the preceding step (**8**, 16 mg, 0.021 mmol), 6-Maleimidyl-caproamidyl-L-valine-L-citrulline (**4**, 16 mg, 0.034 mmol), and EEDQ (15 mg, 0.061 mmol) were weighed into a round bottom flask and dissolved in dry DCM (2 mL) and anhydrous methanol (1 mL). The flask was sealed with a rubber septum, purged with argon, and the reaction stirred at ambient temperature for 18 h. The reaction was concentrated *in vacuo*, dissolved in MeCN/water, and purified directly on a C18 Aq RediSep Gold column via ISCO (gradient elution: 20 – 80% MeCN in water, 0.05% acetic acid in both, over 12 min). The product did not separate well, so the impure product fractions were lyophilized and repurified

twice by preparative HPLC on a Phenomenex Gemini 5u, 30x150mm C18 column (first 40 – 80% then 20 – 80% MeCN in water, 0.1% HOAc both, over 20 min, 30 mL/min). The fractions containing product were combined, partially concentrated *in vacuo*, frozen on dry ice, and lyophilized overnight giving the title compound as a white solid (5 mg, 21%). MS (ESI, pos.): calc'd for $C_{56}H_{74}N_9O_{15}Cl$, 1147.5; found 1148.5 (M+H), 1130.4 (M-H_2O+H), 1170.5 (M+Na). ^{1}H NMR (500 MHz, Methanol-d_4) δ: 7.48 – 7.42 (m, 2H), 7.40 (t, J = 8.3 Hz, 2H), 7.07 (s, 1H), 7.02 (d, J = 1.8 Hz, 1H), 6.69 (d, J = 4.7 Hz, 1H), 6.49 (dd, J = 15.4, 11.1 Hz, 1H), 6.14 (d, J = 8.9 Hz, 1H), 5.33 (dd, J = 15.4, 8.7 Hz, 1H), 4.47 (dd, J = 11.9, 2.9 Hz, 1H), 4.40 (dd, J = 8.9, 5.2 Hz, 1H), 4.25 – 4.14 (m, 1H), 4.07 (dd, J = 12.0, 7.6 Hz, 1H), 3.88 (s, 3H), 3.50 (d, J = 12.7 Hz, 1H), 3.43 (d, J = 8.9 Hz, 1H), 3.38 (t, J = 7.1 Hz, 2H), 3.18 – 3.13 (m, 2H), 3.11 (s, 4H), 3.09 – 2.97 (m, 2H), 2.90 (dd, J = 9.8, 3.7 Hz, 1H), 2.58 – 2.47 (m, 1H), 2.18 (t, J = 7.5 Hz, 2H), 2.14 – 2.04 (m, 2H), 2.00 – 1.92 (m, 1H), 1.87 (d, J = 4.9 Hz, 1H), 1.80 (dd, J = 10.0, 4.8 Hz, 1H), 1.67 (dd, J = 13.7, 2.1 Hz, 2H), 1.63 (s, 4H), 1.59 – 1.41 (m, 8H), 1.41 – 1.33 (m, 2H), 1.25 – 1.17 (m, 4H), 1.17 – 1.09 (m, 4H), 1.04 (d, J = 6.5 Hz, 1H), 0.94 (dd, J = 11.7, 6.7 Hz, 1H), 0.87 (dt, J = 7.9, 4.0 Hz, 6H), 0.77 (s, 3H).

EXAMPLE 26

Conjugate Preparation and Characterization

[0517] Five antibodies were conjugated to the linker-payload compounds of the disclosure using the procedure below. The four targeting antibodies used in these experiments were: (1) a PSMA antibody having the heavy and light chain variable domains of clone AB-PG1-XG1-006 as set forth in International Patent Application Publication No. WO2007/002222 A2, entitled PSMA ANTIBODY-DRUG CONJUGATES, (2) anti-MUC16 antibody having variable regions derived from clone 3A5 from International Patent Application Publication No. WO2007001851, entitled COMPOSITIONS AND METHODS FOR THE DIAGNOSIS AND TREATMENT OF TUMOR, (3) anti-HER2 antibody having variable regions derived from humAb4D5-8 from Carter *et al*, PNAS 1992 89 4285, and (4) an anti-STEAP2 antibody. These patent application publications and journal citations are herein incorporated by reference in their entirety for all purposes. All the monoclonal antibodies were expressed in CHO cells and purified by Protein A. A non-binding isotype control (5) derived from an immunological antigen having no relation to oncology was also used.

[0518] *Method A*: The antibody (10 mg/ml) in 50 mM HEPES, 150 mM NaCl, pH 7.5, was treated with 1 mM dithiothreitol at 37 °C for 30 min. After gel filtration (G-25, pH 4.5 sodium acetate), the maleimido linker payload derivative (for linker-payloads **9, 19**, or **24**; 1.2 equivalents/SH group) in DMSO (10 mg/ml) was added to the reduced antibody and the mixture adjusted to pH 7.0 with 1 M HEPES (pH 7.4). The conjugation reaction was optionally quenched

with N-ethyl maleimide (NEM). The conjugates were purified by size exclusion chromatography and sterile filtered. Protein concentrations and payload to antibody ratios were determined by UV spectral analysis according to Hamblett *et al* (American Association for Cancer Research. 2004 Oct 15:10(20):7063-70) or mass difference, native versus conjugated. Size-exclusion HPLC established that all conjugates used were >95% monomeric, and RP-HPLC established that there was <0.5% unconjugated linker payload. Yields and payload to antibody ratios are reported in Table 1.

[0519] *Method B*: The antibodies (10-20 mg/ml) in 50 mM HEPES, 150 mM NaCl, pH 8.0, and 10-15% (v/v) DMA were conjugated with a 5-6 fold excess of **10**, **14**, **20**, **22**, or **26** for 2 hours (hrs) at ambient temperature. The conjugate was purified by size exclusion chromatography or extensive ultrafiltration and sterile filtered. Protein concentrations were determined by UV spectral analysis. Size-exclusion HPLC established that all conjugates used were >90% monomeric, and RP-HPLC established that there was <1% unconjugated linker payload. All conjugated antibodies were analyzed by mass difference, native versus conjugated. Payload to antibody ratios are reported in Table 1.

[0520] *Method C* - Bacterial Transglutaminase Conjugation*:* Aglycosylated, deglycosylated, or glutamine tagged antibodies can be conjugated at 1-10 mg/mL in PBS pH 7.4. Linker payload **22** can be added in a 10 to 25-fold molar excess over antibody and the enzymatic reaction can be initiated by addition of 1-5 units of bacterial transglutaminase (Zedira, T1001) per mg antibody and incubated with shaking at 37°C for 4-16 hours. The conjugates can be purified by size exclusion chromatography and sterile filtered. Protein and linker payload concentrations can be determined by UV spectral analysis. Size-exclusion HPLC can establish that conjugates can be >95% monomeric. All conjugated antibodies can be analyzed by UV for linker payload loading values according to Hamblett et al, Cancer Res 2004 10 7063. In addition, the conjugates can be analyzed by ESI-MS for linker payload loadings using a Waters Synapt G2-Si QTOF mass spectrometry coupled with Acquity UPLC. The chromatographic separation can be achieved on a C4 column (Waters protein BEH C4, 50 mm X 1 mm, 1.7 μm) in a 25 minute gradient (minute:percentage of mobile pahse B; 0:20%, 1:20%, 18:40%, 18.1:90, 20:95%, 20.8:95%, 20.9:20% 25:20%). The mobile phase A can be 0.1% formic acid in water and mobile phase B can be 0.1% formic acid in acetonitrile. The flow rate can be set at 100

µl/min. The detector TOF scan can be set from m/z 700-5000 for 25 minutes with major parameters as listed (Capillary voltage 3.2 kV; Sampling Cone 150; Source Offset at 80; Source temperatures 120 °C; Desolvation temperature 500 °C; Trap collision Energy 30; Transfer Collision Energy Off; Gas controls OFF; Resolving Quadrupole: LM resolution at 4.7). The combined spectra can be deconvoluted with MaxEnt function within MassLynx software.

Conjugates of Method A DAR Determination

[0521] To determine the loading of the linker-payloads on the antibody (cysteine conjugates), the conjugates were deglycosylated, reduced, and analyzed by LC-MS.

[0522] For the assay, 50 µg of the conjugate was diluted with mili-Q water to a final concentration of 1 mg/mL. Ten µL of PNGase F solution [PNGase F solution was prepared by adding 150 µL of PNGase F stock (New England Biolabs, Cat#P0704L) and 850 µL of mili-Q water and mixed well] was added to the diluted conjugate solution and then incubated at 37°C overnight. 2.4 µL of 0.5 M TCEP was added to the sample such that the resulting material had a final TCEP concentration of 20 mM and this was then incubated at 50°C for 30 minutes. Injections of 10 µL of each sample were made onto LC-MS (Waters Synat G2-Si) and eluted with 0.1 mL/minute of a gradient mobile phase 20-40% of mobile phase B over 25 minutes (Mobile Phase A: 0.1%v/v FA in H_2O; Mobile Phase B: 0.1% v/v FA in Acetonitrile). The LC separation was achieved on Waters Acquity BEH C18 column (1.0 X 50 mM, 1.7 µM).

[0523] The mass spectrometry spectra were deconvoluted and the identified light and heavy chain peaks represent the light chain (L) with linker-payload values = 0 and 1, heavy chain (H) with linker-payload values = 0, 1, 2, and 3. From the intensity values of each species, the drug to antibody ratio (DAR) was calculated using equation 1 below for a homo-dimer antibody conjugate.

Equation 1:

$$DAR = 2^* \left[\frac{L1}{L0 + L1} + \frac{H1 + 2^*H2 + 3^*H3}{H0 + H1 + H2 + H3} \right]$$

Conjugates of Method B DAR Determination

[0524] To determine the loading of the linker-payloads on the antibody (lysine conjugates), the conjugates were deglycosylated, and analyzed by LC-MS.

[0525] For the assay, 50 µg of the conjugate was diluted with milli-Q water to a final concentration of 1 mg/mL. Ten µL of PNGase F solution [PNGase F solution was prepared by adding 150 µL of PNGase F stock (New England Biolabs, Cat#P0704L) and 850 µL of milli-Q water and mixed well] was added to the diluted conjugate solution and then incubated at 37°C overnight. Injections of 5 µL of each sample were made onto LC-MS (Waters Synat G2-Si) and eluted with 0.1 mL/minute of a gradient mobile phase 20-50% of mobile phase B over 25 minutes (Mobile Phase A: 0.1%v/v FA in H_2O; Mobile Phase B: 0.1% v/v FA in Acetonitrile). The LC separation was achieved on a Waters Acquity BEH C4 column (1.0 X 50 mM, 1.7 µM) at 80 °C.

[0526] The mass spectrometry spectra were deconvoluted using Masslynx software and the drug to antibody ratio (DAR) was calculated using the following equations. *See* FIG. 18.

1. Relative percentage (%) of drug (Dn) by distribution peak intensity (PI):
    a. $Dn\% = PIn / \Sigma(PI0+PI1+PI2.....+PIi)\times 100$
    b. $(n= 0,1,2,3,\ldots,i)$
2. Average DAR calculation:
    a. $DAR=\Sigma(1\times D1\%+2\times D2\%+3\times D3\%+.....+i\times Di\%)$

EXAMPLE 27

In Vitro Linker-Payload Cell-free Enzymatic Assays

Cathepsin B incubation

[0527] *In vitro* cell-free enzymatic assay procedure was adopted from Dubowchik, *et al.* Bioconjugate Chem. **2002** *13* 855, the entire contents of which are herein incorporated by

reference in its entirety for all purposes. The linker payload **9** was set at 100 μg/mL final in 25 mM sodium acetate buffer, 1 mM EDTA, pH 5.0 and pre-incubated at 37°C. Cathepsin B (Sigma # C8571) was activated at room temperature for 15 minutes with 1 equivalent of 30 mM DTT, 15 mM EDTA to 2 equivalents of cathepsin B stock. The activated cathepsin B solution was added to the substrate solutions at a 1:20 molar ratio (purified H_2O, instead of activated cathepsin B was added for the control sample.) Samples were incubated at 37°C overnight and the resulting samples are detected by LC-MS through Q1 Scan.

LC-MS detection

[0528] Samples are centrifuged at 12,000 g for 5 min. Supernatant was recovered and analyzed by liquid chromatography-mass spectrometry (Waters Xevo TQ-S) by combined infusion of 0.3 ml/min of 30:70 mobile phase B:A (Mobile Phase A: 0.1%FA in H_2O; Mobile Phase B: 0.1% FA in Acetonitrile) at 20 μl/min from supernatant. MS1 is set at an appropriate range for detection of molecular ion of either linker payload or payload. The supernatant contained the predicted payload, Maytan-3-O-carbamoyl-N-(4-aminobenzene) (**8**), with a mass of 720.9 (M+Na) (calc'd monoisotopic mass for $C_{35}H_{43}N_4O_9Cl$, 698.3) and the control samples without cathepsin B contained **9** with a mass of 1170.4 (M+Na) (calc'd monoisotopic mass for $C_{60}H_{80}ClN_9O_{16}$, 1147.50). No predicted payload molecular ion was detected in the control samples.

[0529] The results of this Example are significant in part because cathepsin B proteolysis of **9** should only occur after internalization of the ADC in the cell where the enzyme exists. Off target effects should be reduced since the antibody delivers the cytotoxic payload directly to targeted cells.

EXAMPLE 28

In Vitro Cytotoxicity Assays

[0530] In this Example, the ability of various antibody-drug conjugates and naked payloads to kill antigen-expressing tumor cells *in vitro* was assessed.

[0531] Ovcar3 (Muc16+) cells were seeded in 96 well plates at 3000 cells per well in complete growth media and grown overnight. For cell viability curves, serially diluted

conjugates or naked payloads were added to the cells at final concentrations ranging from 100 nM to 5 pM and incubated for 3 days. To measure viability, cells were incubated with CCK8 (Dojindo) for the final 2 hours and the absorbance at 450nm (OD_{450}) was determined on a Victor (Perkin Elmer). Background OD_{450} levels determined from digitonin (40 nM) treated cells were subtracted from all wells and viability is expressed as a percentage of the untreated controls. IC_{50} values were determined from a four-parameter logistic equation over a 10-point response curve (GraphPad Prism). The IC_{50} for the MUC16-**9** ADC was +++ which indicates an IC_{50} (nM) greater than, or equal to, 0.1 and less than 1.0. All curves and IC_{50} values are corrected for payload equivalents. The plot of % Cell Viability vs. Log10 [M] Drug is shown in FIG 1. Naked payload IC_{50} values and percent cell kill are listed in Table 2.

[0532] SKBR3 (Her2+) cells were seeded in 96 well plates at 8000 cells per well in complete growth media and grown overnight. For cell viability curves, serially diluted conjugates or naked payloads were added to the cells at final concentrations ranging from 100 nM to 5 pM and incubated for 3 days. To measure viability, cells were incubated with CCK8 (Dojindo) for the final 2 hours and the absorbance at 450nm (OD_{450}) was determined on a Victor (Perkin Elmer). Background OD_{450} levels determined from digitonin (40 nM) treated cells were subtracted from all wells and viability is expressed as a percentage of the untreated controls. IC_{50} values were determined from a four-parameter logistic equation over a 10-point response curve (GraphPad Prism). The IC_{50} for the HER2-**9**, **10**, **20**, and **24** ADCs was +++, +++, +++, and +++, respectively, wherein +++ indicates IC_{50} (nM) greater than, or equal to, 0.1 and less than 1.0. All curves and IC_{50} values are corrected for payload equivalents. The plot of % Cell Viability vs. Log10 [M] Drug is shown in FIGS 2-5. Naked payload IC_{50} values and percent cell kill are listed in Table 2.

[0533] C4-2 (STEAP2+) cells were seeded in 96 well plates at 4000 cells per well in complete growth media and grown overnight. For cell viability curves, serially diluted conjugates or naked payloads were added to the cells at final concentrations ranging from 100 nM to 5 pM and incubated for 5 days. To measure viability, cells were incubated with CellTiter-Glo reagents for 5 minutes and luminescence was determined on a Victor plate reader (PerkinElmer). IC_{50} values were determined from a four-parameter logistic equation over a 10-point response curve (GraphPad Prism). The IC_{50} for the STEAP2-**14**, **20**, and **24** ADCs were ++, +++, + nM, respectively. +++ indicates IC_{50} (nM) greater than, or equal to, 0.1 and less than

1.0; ++ indicates IC_{50} (nM) greater than, or equal to, 1.0 and less than 10; and + indicates IC_{50} (nM) greater than, or equal to, 10.

[0534] All IC_{50}s are expressed in nM concentration and % kill is reported for the highest dose. All curves and IC_{50} values are corrected for payload equivalents. The plot of % Cell Viability vs. Log10 [M] Drug is shown in FIGS 6-8. Naked payload IC_{50} values and percent cell kill are listed in Table 2.
