RELATED APPLICATIONS

Cross-Reference to Related Applications

[0001] This application claims the benefit of U.S. Provisional Application No. 61/620,107, filed April 4, 2012, which is incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

Field of the Invention

[0002] This invention relates to inhibitors of one or more proteins in the Wnt pathway, including inhibitors of one or more Wnt proteins, and compositions comprising the same. More particularly, it concerns the use of an indazole compound or salts or analogs thereof, in the treatment of disorders characterized by the activation of Wnt pathway signaling (e.g., cancer, abnormal cellular proliferation, angiogenesis, Alzheimer's disease, lung disease and osteoarthritis), the modulation of cellular events mediated by Wnt pathway signaling, as well as genetic diseases and neurological conditions/disorders/diseases due to mutations or dysregulation of the Wnt pathway and/or of one or more of Wnt signaling components. Also provided are methods for treating Wnt-related disease states.

Description of the Related Art

[0003] Pattern formation is the activity by which embryonic cells form ordered spatial arrangements of differentiated tissues. Speculation on the mechanisms underlying these patterning effects usually centers on the secretion of a signaling molecule that elicits an appropriate response from the tissues being patterned. More recent work aimed at the identification of such signaling molecules implicates secreted proteins encoded by individual members of a small number of gene families.

[0004] A longstanding idea in cancer biology is that cancers arise and grow due to the formation of cancer stem cells, which may constitute only a minority of the cells within a tumor but are nevertheless critical for its propagation. Stem cells are appealing as the cell of origin for cancer because of their pre-existing capacity for self-

renewal and for unlimited replication. In addition, stem cells are relatively long-lived in comparison to other cells within tissues, providing a greater opportunity to accumulate the multiple additional mutations that may be required to increase the rate of cell proliferation and produce clinically significant cancers. Of particular recent interest in the origin of cancer is the observation that the Wnt signaling pathway, which has been implicated in stem cell self-renewal in normal tissues, upon continuous activation has also been associated with the initiation and growth of many types of cancer. This pathway thus provides a potential link between the normal self-renewal of stem cells and the aberrantly regulated proliferation of cancer stem cells.

[0005] The Wnt growth factor family includes more than 10 genes identified in the mouse and at least 7 genes identified in the human. Members of the Wnt family of signaling molecules mediate many important short-and long-range patterning processes during invertebrate and vertebrate development. The Wnt signaling pathway is known for its important role in the inductive interactions that regulate growth and differentiation, and likely also plays important roles in the homeostatic maintenance of post-embryonic tissue integrity. Wnt stabilizes cytoplasmic p-catenin, which stimulates the expression of genes including c-myc, c jun, fra-1, and cyclin D1. In addition, misregulation of Wnt signaling can cause developmental defects and is implicated in the genesis of several human cancers. More recently, the Wnt pathway has been implicated in the maintenance of stem or progenitor cells in a growing list of adult tissues that now includes skin, blood, gut, prostate, muscle and the nervous system.

[0006] Pathological activation of the Wnt pathway is also believed to be the initial event leading to colorectal cancer in over 85% of all sporadic cases in the Western world. Activation of the Wnt pathway has also been extensively reported for hepatocellular carcinoma, breast cancer, ovarian cancer, pancreatic cancer, melanomas, mesotheliomas, lymphomas and leukemias. In addition to cancer, inhibitors of the Wnt pathway can be used for stem cell research or for the treatment of any diseases characterized by aberrant Wnt activation such as diabetic retinopathy, pulmonary fibrosis, rheumatoid arthritis, scleroderma as well as mycotic and viral infections and bone and cartilage diseases. As such, it is a therapeutic target that is of great interest to the field.

[0007] In addition to cancer, there are many cases of genetic diseases due to mutations in Wnt signaling components. Examples of some of the many diseases are Alzheimer's disease [*Proc. Natl. Acad. Sci. U S A* (2007), 104(22), 9434-9], osteoarthritis, polyposis coli [*Science* (1991), 253(5020), 665-669], bone density and vascular defects in the eye (osteoporosis-pseudoglioma syndrome, OPPG) [*N. [0008] Regulation of cell signaling by the Wnt signaling pathway is critical for the formation of neuronal circuits. Wnt pathway modulates in neural tissue, among other things, axon pathfinding, dendritic development, and synaptic assembly. Through different receptors, Wnt pathway activates and/or regulates diverse signaling pathways and other processes that lead to local changes on the cytoskeleton or global cellular

changes involving nuclear function. Recently, a link between neuronal activity, essential for the formation and refinement of neuronal connections, and Wnt signaling has been uncovered. Indeed, neuronal activity regulates the release of various Wnt proteins and the localization of their receptors. Wnt pathway mediates synaptic structural changes induced by neuronal activity or experience. Evidence suggests that dysfunction in Wnt signaling contributes to neurological disorders [*Brain Research Reviews* (2000), 33(1), 1–12; *Oncogene* (2006) 25(57), 7545-7553; *Molecular Neurodegeneration* (2008), 3, 9; *Neurobiology of Disease* (2010), 38(2), 148–153; *Journal of Neurodevelopmental Disorders* (2011), 3(2), 162–174 and *Cold Spring Harbor Perspectives in Biology* February (2012), 4(2)].

Definitions

[0023] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as is commonly understood by one of ordinary skill in the art to which this disclosure belongs. All patents, applications, published applications, and other publications are incorporated by reference in their entirety. In the event that there is a plurality of definitions for a term herein, those in this section prevail unless stated otherwise.

[0024] In this specification and in the claims, the following terms have the meanings as defined. As used herein, "alkyl" means a branched, or straight chain chemical group containing only carbon and hydrogen, such as methyl, ethyl, n-propyl

isopropyl, n-butyl, isobutyl, sec-butyl, *tert*-butyl, n-pentyl, *tert*-pentyl, neopentyl, isopentyl and sec-pentyl. Alkyl groups can either be unsubstituted or substituted with one or more substituents, e.g., halide, alkoxy, acyloxy, amino, amido, cyano, nitro, hydroxyl, thio, carboxy, carbonyl, benzyloxy, aryl, heteroaryl, heterocyclyl, carbocyclyl, or other functionality that may be suitably blocked, if necessary for purposes of the invention, with a protecting group. Alkyl groups can be saturated or unsaturated (e.g., containing -C=C- or -C≡C- subunits), at one or several positions. Typically, alkyl groups will comprise 1 to 9 carbon atoms, preferably 1 to 6, more preferably 1 to 4, and most preferably 1 to 2 carbon atoms.

[0025] As used herein, “carbocyclyl” means a cyclic ring system containing only carbon atoms in the ring system backbone, such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, and cyclohexenyl. Carbocyclyls may include multiple fused rings. Carbocyclyls may have any degree of saturation provided that at least one ring in the ring system is not aromatic. Carbocyclyl groups can either be unsubstituted or substituted with one or more substituents, e.g., alkyl, halide, alkoxy, acyloxy, amino, amido, cyano, nitro, hydroxyl, mercapto, carboxy, carbonyl, benzyloxy, aryl, heteroaryl, or other functionality that may be suitably blocked, if necessary for purposes of the invention, with a protecting group. Typically, carbocyclyl groups will comprise 3 to 10 carbon atoms, preferably 3 to 6.

[0026] As used herein, “lower alkyl” means a subset of alkyl, and thus is a hydrocarbon substituent, which is linear, or branched. Preferred lower alkyls are of 1 to about 4 carbons, and may be branched or linear. Examples of lower alkyl include butyl, propyl, isopropyl, ethyl, and methyl. Likewise, radicals using the terminology “lower” refer to radicals preferably with 1 to about 4 carbons in the alkyl portion of the radical.

[0027] As used herein, “amido” means a H-CON- or alkyl-CON-, carbocyclyl-CON-, aryl-CON-, heteroaryl-CON- or heterocyclyl-CON group wherein the alkyl, carbocyclyl, heteroaryl, aryl or heterocyclyl group is as herein described.

[0028] As used herein, “aryl” means an aromatic radical having a single-ring (e.g., phenyl) or multiple condensed rings (e.g., naphthyl or anthryl) with only carbon atoms present in the ring backbone. Aryl groups can either be unsubstituted or substituted with one or more substituents, e.g., amino, cyano, hydroxyl, lower alkyl, haloalkyl,

alkoxy, nitro, halo, mercapto, and other substituents. A preferred carbocyclic aryl is phenyl.

[0029] As used herein, the term “heteroaryl” means an aromatic radical having one or more heteroatom(s) (e.g., N, O, or S) in the ring backbone and may include a single ring (e.g., pyridine) or multiple condensed rings (e.g., quinoline). Heteroaryl groups can either be unsubstituted or substituted with one or more substituents, e.g., amino, cyano, hydroxyl, lower alkyl, haloalkyl, alkoxy, nitro, halo, mercapto, and other substituents. Examples of heteroaryls include thienyl, pyridinyl, furyl, oxazolyl, oxadiazolyl, pyrrolyl, imidazolyl, triazolyl, thiodiazolyl, pyrazolyl, isoxazolyl, thiadiazolyl, pyranlyl, pyrazinyl, pyrimidinyl, pyridazinyl, triazinyl, thiazolyl, benzothienyl, benzoxadiazolyl, benzofuranyl, benzimidazolyl, benzotriazolyl, cinnolinyl, indazolyl, indolyl, isoquinolinyl, isothiazolyl, naphthyridinyl, purinyl, thienopyridinyl, pyrido[2,3-*d*]pyrimidinyl, pyrrolo[2,3-*b*]pyridinyl, quinazolinyl, quinolinyl, thieno[2,3-*c*]pyridinyl, pyrazolo[3,4-*b*]pyridinyl, pyrazolo[3,4-*c*]pyridinyl, pyrazolo[4,3-*c*]pyridine, pyrazolo[4,3-*b*]pyridinyl, tetrazolyl, and others.

[0030] In these definitions it is clearly contemplated that substitution on the aryl and heteroaryl rings is within the scope of certain embodiments. Where substitution occurs, the radical is called substituted aryl or substituted heteroaryl. Preferably one to three and more preferably one or two substituents occur on the aryl ring. Though many substituents will be useful, preferred substituents include those commonly found in aryl compounds, such as alkyl, carbocyclyl, hydroxy, alkoxy, cyano, halo, haloalkyl, mercapto and the like.

[0031] As used herein, “amide” includes both $\text{RNR}'\text{CO}-$ and $\text{RCONR}'-$. R can be substituted or unsubstituted alkyl, substituted or unsubstituted heterocyclyl, substituted or unsubstituted heteroaryl, substituted or unsubstituted aryl, or substituted or unsubstituted carbocyclyl. R' can be H or substituted or unsubstituted alkyl.

[0032] As used herein, “halo”, “halide” or “halogen” is a chloro, bromo, fluoro or iodo atom radical. Chloro, bromo and fluoro are preferred halides. Most preferred halide is fluorine.

[0033] As used herein, "haloalkyl" means a hydrocarbon substituent, which is a linear or branched or cyclic alkyl, alkenyl or alkynyl substituted with chloro, bromo, fluoro or iodo atom(s). Most preferred of these are fluoroalkyls, wherein one or more of the hydrogen atoms have been substituted by fluoro. Preferred haloalkyls are of 1 to about 3 carbons in length, more preferred haloalkyls are 1 to about 2 carbons, and most preferred are 1 carbon in length. The skilled artisan will recognize then that as used herein, "haloalkylene" means a diradical variant of haloalkyl, such diradicals may act as spacers between radicals, other atoms, or between the parent ring and another functional group.

[0034] As used herein, "heterocyclyl" means a cyclic ring system comprising at least one heteroatom in the ring system backbone. Heterocyclyls may include multiple fused rings. More preferred heterocycles are of 5-7 members. In six membered monocyclic heterocycles, the heteroatom(s) are selected from one up to three of O, N or S, and wherein when the heterocycle is five membered, preferably it has one or two heteroatoms selected from O, N, or S. Examples of heterocyclyl include aziriny, aziridinyl, azetidiny, oxetanyl, thietanyl, 1,4,2-dithiazolyl, 1,3-benzodioxolyl, dihydroisindolyl, dihydroisoquinoliny, dihydrocinnoliny, dihydrobenzodioxiny, dihydro[1,3]oxazolo[4,5-*b*]pyridiny, benzothiazolyl, dihydroindolyl, dihydropyridiny, 1,3-dioxanyl, 1,4-dioxanyl, 1,3-dioxolanyl, isoindoliny, morpholiny, thiomorpholiny, piperaziny, pyranyl, pyrrolidiny, tetrahydrofuryl, tetrahydropyridiny, oxaziny, thiaziny, thiiny, thiazolidiny, isothiazolidiny, oxazolidiny, isoxazolidiny, piperidiny, pyrazolidiny, imidazolidiny, thiomorpholiny, and others.

[0036] As used herein, "substituted thiol" means RS- group wherein R is an alkyl, an aryl, heteroaryl or a heterocyclyl group, wherein the alkyl, carbocyclyl, aryl, heteroaryl or heterocyclyl are defined as above.

[0037] As used herein, "sulfonyl" means an alkylSO₂, arylSO₂, heteroarylSO₂, carbocyclylSO₂, or heterocyclyl-SO₂ group wherein the alkyl, carbocyclyl, aryl, heteroaryl or heterocyclyl are defined as above.

[0038] As used herein, "sulfonamido" means an alkyl-S(O)₂N-, aryl-S(O)₂N-, heteroaryl-S(O)₂N-, carbocyclyl-S(O)₂N- or heterocyclyl-S(O)₂N- group wherein the alkyl, carbocyclyl, aryl, heteroaryl or heterocyclyl group is as herein described.

[0039] As used herein, when two groups are indicated to be "linked" or "bonded" to form a "ring," it is to be understood that a bond is formed between the two groups and may involve replacement of a hydrogen atom on one or both groups with the bond, thereby forming a carbocyclyl, heterocyclyl, aryl, or heteroaryl ring. The skilled artisan will recognize that such rings can and are readily formed by routine chemical reactions, and it is within the purview of the skilled artisan to both envision such rings and the methods of their formations. Preferred are rings having from 3-7 members, more preferably 5 or 6 members. As used herein the term "ring" or "rings" when formed by the combination of two radicals refers to heterocyclic, carbocyclic, aryl, or heteroaryl rings.

[0040] The skilled artisan will recognize that some structures described herein may be resonance forms or tautomers of compounds that may be fairly represented by other chemical structures, even when kinetically; the artisan recognizes that such structures are only a very small portion of a sample of such compound(s). Such compounds are clearly contemplated within the scope of this invention, though such resonance forms or tautomers are not represented herein.

[0041] The compounds provided herein may encompass various stereochemical forms. The compounds also encompasses diastereomers as well as optical isomers, e.g. mixtures of enantiomers including racemic mixtures, as well as individual enantiomers and diastereomers, which arise as a consequence of structural asymmetry in certain compounds. Separation of the individual isomers or selective synthesis of the individual isomers is accomplished by application of various methods which are well known to practitioners in the art. Unless otherwise indicated, when a disclosed

compound is named or depicted by a structure without specifying the stereochemistry and has one or more chiral centers, it is understood to represent all possible stereoisomers of the compound.

[0042] The term “administration” or “administering” refers to a method of giving a dosage of a compound or pharmaceutical composition to a vertebrate or invertebrate, including a mammal, a bird, a fish, or an amphibian, where the method is, *e.g.*, orally, subcutaneously, intravenously, intranasally, topically, transdermally, intraperitoneally, intramuscularly, intrapulmonarily, vaginally, rectally, ontologically, neuro-otologically, intraocularly, subconjunctivally, via anterior eye chamber injection, intravitreally, intraperitoneally, intrathecally, intracystically, intrapleurally, via wound irrigation, intrabuccally, intra-abdominally, intra-articularly, intra-aurally, intrabronchially, intracapsularly, intrameningeally, via inhalation, via endotracheal or endobronchial instillation, via direct instillation into pulmonary cavities, intraspinally, intrasynovially, intrathoracically, via thoracostomy irrigation, epidurally, intratympanically, intracisternally, intravascularly, intraventricularly, intraosseously, via irrigation of infected bone, or via application as part of any admixture with a prosthetic device. [0043] A “diagnostic” as used herein is a compound, method, system, or device that assists in the identification and characterization of a health or disease state. The diagnostic can be used in standard assays as is known in the art.

[0044] The term “mammal” is used in its usual biological sense. Thus, it specifically includes humans, cattle, horses, dogs, and cats, but also includes many other species.

[0045] The term “pharmaceutically acceptable carrier” or “pharmaceutically acceptable excipient” includes any and all solvents, co-solvents, complexing agents, dispersion media, coatings, antibacterial and antifungal agents, isotonic and absorption delaying agents and the like which are not biologically or otherwise undesirable. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active

ingredient, its use in the therapeutic compositions is contemplated. Supplementary active ingredients can also be incorporated into the compositions. In addition, various adjuvants such as are commonly used in the art may be included. These and other such compounds are described in the literature, *e.g.*, in the Merck Index, Merck & Company, Rahway, NJ. Considerations for the inclusion of various components in pharmaceutical compositions are described, *e.g.*, in Gilman *et al.* (Eds.) (2010); Goodman and Gilman's: The Pharmacological Basis of Therapeutics, 12th Ed., The McGraw-Hill Companies.

[0046] The term "pharmaceutically acceptable salt" refers to salts that retain the biological effectiveness and properties of the compounds provided herein and, which are not biologically or otherwise undesirable. In many cases, the compounds provided herein are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto. Pharmaceutically acceptable acid addition salts can be formed with inorganic acids and organic acids. Inorganic acids from which salts can be derived include, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like. [0047] "Solvate" refers to the compound formed by the interaction of a solvent and a Wnt pathway inhibitor, a metabolite, or salt thereof. Suitable solvates are pharmaceutically acceptable solvates including hydrates.

[0048] “Patient” as used herein, means a human or a non-human mammal, *e.g.*, a dog, a cat, a mouse, a rat, a cow, a sheep, a pig, a goat, a non-human primate or a bird, *e.g.*, a chicken, as well as any other vertebrate or invertebrate.

[0049] By “therapeutically effective amount” or “pharmaceutically effective amount” of a compound as provided herein is one which is sufficient to achieve the desired effect and may vary according to the nature and severity of the disease condition, and the potency of the compound. “Therapeutically effective amount” is also intended to include one or more of the compounds of Formula (I) in combination with one or more other agents that are effective to inhibit Wnt related diseases and/or conditions. The combination of compounds is preferably a synergistic combination. Synergy, as described, for example, by Chou, *Cancer Research* (2010), 70(2), 440-446, occurs when the effect of the compounds when administered in combination is greater than the additive effect of the compounds when administered alone as a single agent. In general, a synergistic effect is most clearly demonstrated at sub-optimal concentrations of the compounds. It will be appreciated that different concentrations may be employed for prophylaxis than for treatment of an active disease. This amount can further depend upon the patient’s height, weight, sex, age and medical history.

[0050] A therapeutic effect relieves, to some extent, one or more of the symptoms of the disease, and includes curing a disease. “Curing” means that the symptoms of active disease are eliminated. However, certain long-term or permanent effects of the disease may exist even after a cure is obtained (such as extensive tissue damage).

[0051] “Treat,” “treatment,” or “treating,” as used herein refers to administering a compound or pharmaceutical composition as provided herein for therapeutic purposes. The term “therapeutic treatment” refers to administering treatment to a patient already suffering from a disease thus causing a therapeutically beneficial effect, such as ameliorating existing symptoms, preventing additional symptoms, ameliorating or preventing the underlying metabolic causes of symptoms, postponing or preventing the further development of a disorder and/or reducing the severity of symptoms that will or are expected to develop.

[0052] “Drug-eluting” and or controlled release as used herein refers to any and all mechanisms, e.g., diffusion, migration, permeation, and/or desorption by which the drug(s) incorporated in the drug-eluting material pass therefrom over time into the surrounding body tissue.

[0053] “Drug-eluting material” and or controlled release material as used herein refers to any natural, synthetic or semi-synthetic material capable of acquiring and retaining a desired shape or configuration and into which one or more drugs can be incorporated and from which incorporated drug(s) are capable of eluting over time.

[0054] “Elutable drug” as used herein refers to any drug or combination of drugs having the ability to pass over time from the drug-eluting material in which it is incorporated into the surrounding areas of the body.

In addition, the compounds can be used as inhibitors of one or more kinases, kinase receptors, or kinase complexes. Such compounds and compositions are also useful for controlling cellular proliferation, differentiation, and/or apoptosis.

[00194] In one preferred embodiment, the compositions can be administered to the respiratory tract (including nasal and pulmonary) e.g., through a nebulizer, metered-dose inhalers, atomizer, mister, aerosol, dry powder inhaler, insufflator, liquid instillation or other suitable device or technique.

[00195] In some embodiments, aerosols intended for delivery to the nasal mucosa are provided for inhalation through the nose. For optimal delivery to the nasal cavities, inhaled particle sizes of about 5 to about 100 microns are useful, with particle sizes of about 10 to about 60 microns being preferred. For nasal delivery, a larger inhaled particle size is desired to maximize impaction on the nasal mucosa and to minimize or prevent pulmonary deposition of the administered formulation. In some embodiments, aerosols intended for delivery to the lung are provided for inhalation through the nose or the mouth. For optimal delivery to the lung, inhaled aerodynamic particle sizes of about less than 10 μ m are useful, with an aerodynamic particle size of about 1 to about 10 microns being preferred. Inhaled particles may be defined as liquid droplets containing dissolved drug, liquid droplets containing suspended drug particles (in cases where the drug is insoluble in the suspending medium), dry particles of pure drug substance, drug substance incorporated with excipients, liposomes, emulsions, colloidal systems, coacervates, aggregates of drug nanoparticles, or dry particles of a diluent which contain embedded drug nanoparticles.

[00196] In some embodiments, compounds of Formula (I) disclosed herein intended for respiratory delivery (either systemic or local) can be administered as aqueous formulations, as non-aqueous solutions or suspensions, as suspensions or solutions in halogenated hydrocarbon propellants with or without alcohol, as a colloidal system, as emulsions, coacervates or as dry powders. Aqueous formulations may be aerosolized by liquid nebulizers employing either hydraulic or ultrasonic atomization or by modified micropump systems (like the soft mist inhalers, the Aerodose® or the AERx® systems). Propellant-based systems may use suitable pressurized metered-dose inhalers (pMDIs). Dry powders may use dry powder inhaler devices (DPIs), which are capable of dispersing the drug substance effectively. A desired particle size and distribution may be obtained by choosing an appropriate device.

[00197] In some embodiments, the compositions of Formula (I) disclosed herein can be administered to the ear by various methods. For example, a round window catheter (e.g., U.S. Pat. Nos. 6,440,102 and 6,648,873) can be used.

[00198] Alternatively, formulations can be incorporated into a wick for use between the outer and middle ear (e.g., U.S. Pat. No. 6,120,484) or absorbed to collagen sponge or other solid support (e.g., U.S. Pat. No. 4,164,559).

[00199] If desired, formulations of the invention can be incorporated into a gel formulation (e.g., U.S. Pat. Nos. 4,474,752 and 6,911,211).

[00200] In some embodiments, compounds of Formula (I) disclosed herein intended for delivery to the ear can be administered via an implanted pump and delivery system through a needle directly into the middle or inner ear (cochlea) or through a cochlear implant stylet electrode channel or alternative prepared drug delivery channel such as but not limited to a needle through temporal bone into the cochlea.

[00201] Other options include delivery via a pump through a thin film coated onto a multichannel electrode or electrode with a specially imbedded drug delivery channel (pathways) carved into the thin film for this purpose. In other embodiments the acidic or basic solid compound of Formula I can be delivered from the reservoir of an external or internal implanted pumping system.

[00202] Formulations of the invention also can be administered to the ear by intratympanic injection into the middle ear, inner ear, or cochlea (e.g., U.S. Pat. No. 6,377,849 and Ser. No. 11/337,815).

[00203] Intratympanic injection of therapeutic agents is the technique of injecting a therapeutic agent behind the tympanic membrane into the middle and/or inner ear. In one embodiment, the formulations described herein are administered directly onto the round window membrane via transtympanic injection. In another embodiment, the ion channel modulating agent auris-acceptable formulations described herein are administered onto the round window membrane via a non-transtympanic approach to the inner ear. In additional embodiments, the formulation described herein is administered onto the round window membrane via a surgical approach to the round window membrane comprising modification of the crista fenestrae cochleae.

[00204] In some embodiments, the compounds of Formula (I) are formulated in rectal compositions such as enemas, rectal gels, rectal foams, rectal aerosols, suppositories, jelly suppositories, or retention enemas, containing conventional suppository bases such as cocoa butter or other glycerides, as well as synthetic polymers such as polyvinylpyrrolidone, PEG (like PEG ointments), and the like.

[00205] Suppositories for rectal administration of the drug (either as a solution, colloid, suspension or a complex) can be prepared by mixing the drug with a suitable non-irritating excipient that is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt or erode/dissolve in the rectum and release the drug. Such materials include cocoa butter, glycerinated gelatin, hydrogenated vegetable oils, poloxamers, mixtures of polyethylene glycols of various molecular weights and fatty acid esters of polyethylene glycol. In suppository forms of the compositions, a low-melting wax such as, but not limited to, a mixture of fatty acid glycerides, optionally in combination with cocoa butter is first melted.

[00206] Solid compositions can be provided in various different types of dosage forms, depending on the physicochemical properties of the drug, the desired dissolution rate, cost considerations, and other criteria. In one of the embodiments, the solid composition is a single unit. This implies that one unit dose of the drug is comprised in a single, physically shaped solid form or article. In other words, the solid composition

is coherent, which is in contrast to a multiple unit dosage form, in which the units are incoherent.

[00207] Examples of single units which may be used as dosage forms for the solid composition include tablets, such as compressed tablets, film-like units, foil-like units, wafers, lyophilized matrix units, and the like. In a preferred embodiment, the solid composition is a highly porous lyophilized form. Such lyophilizates, sometimes also called wafers or lyophilized tablets, are particularly useful for their rapid disintegration, which also enables the rapid dissolution of the active compound.

[00208] On the other hand, for some applications the solid composition may also be formed as a multiple unit dosage form as defined above. Examples of multiple units are powders, granules, microparticles, pellets, mini-tablets, beads, lyophilized powders, and the like. In one embodiment, the solid composition is a lyophilized powder. Such a dispersed lyophilized system comprises a multitude of powder particles, and due to the lyophilization process used in the formation of the powder, each particle has an irregular, porous microstructure through which the powder is capable of absorbing water very rapidly, resulting in quick dissolution. Effervescent compositions are also contemplated to aid the quick dispersion and absorption of the compound.

[00209] Another type of multiparticulate system which is also capable of achieving rapid drug dissolution is that of powders, granules, or pellets from water-soluble excipients which are coated with the drug, so that the drug is located at the outer surface of the individual particles. In this type of system, the water-soluble low molecular weight excipient is useful for preparing the cores of such coated particles, which can be subsequently coated with a coating composition comprising the drug and, preferably, one or more additional excipients, such as a binder, a pore former, a saccharide, a sugar alcohol, a film-forming polymer, a plasticizer, or other excipients used in pharmaceutical coating compositions.

[00210] Also provided herein are kits. Typically, a kit includes one or more compounds or compositions as described herein. In certain embodiments, a kit can include one or more delivery systems, e.g., for delivering or administering a compound as provided herein, and directions for use of the kit (e.g., instructions for treating a patient). In another embodiment, the kit can include a compound or composition as described

herein and a label that indicates that the contents are to be administered to a patient with cancer. In another embodiment, the kit can include a compound or composition as described herein and a label that indicates that the contents are to be administered to a patient with one or more of hepatocellular carcinoma, colon cancer, leukemia, lymphoma, sarcoma, ovarian cancer, diabetic retinopathy, pulmonary fibrosis, rheumatoid arthritis, scleroderma, mycotic and viral infections, bone and cartilage diseases, Alzheimer's disease, lung disease, osteoarthritis, polyposis coli, bone density and vascular defects in the eye (Osteoporosis-pseudoglioma Syndrome, OPPG), familial exudative vitreoretinopathy, retinal angiogenesis, early coronary disease, tetra-amelia, Müllerian-duct regression and virilization, SERKAL syndrome, type II diabetes, Fuhrmann syndrome, Al-Awadi/Raas-Rothschild/Schinzel phocomelia syndrome, odonto-onycho-dermal dysplasia, obesity, split-hand/foot malformation, caudal duplication, tooth agenesis, Wilms tumor, skeletal dysplasia, focal dermal hypoplasia, autosomal recessive anonychia, neural tube defects, alpha-thalassemia (ATR-X) syndrome, fragile X syndrome, ICF syndrome, Angelman's syndrome, Prader-Willi syndrome, Beckwith-Wiedemann Syndrome, Norrie disease and Rett syndrome. The actual dose of the active compounds of the present invention depends on the specific compound, and on the condition to be treated; the selection of the appropriate dose is well within the knowledge of the skilled artisan.

[00211] The compounds and compositions provided herein can be used as inhibitors and/or modulators of one or more components of the Wnt pathway, which may include one or more Wnt proteins, and thus can be used to treat a variety of disorders and diseases in which aberrant Wnt signaling is implicated, such as cancer and other diseases associated with abnormal angiogenesis, cellular proliferation, and cell cycling. Accordingly, the compounds and compositions provided herein can be used to treat cancer, to reduce or inhibit angiogenesis, to reduce or inhibit cellular proliferation, to correct a genetic disorder, and/or to treat a neurological condition/disorder/disease due to mutations or dysregulation of the Wnt pathway and/or of one or more of Wnt signaling components. Non-limiting examples of diseases which can be treated with the

compounds and compositions provided herein include a variety of cancers, diabetic retinopathy, pulmonary fibrosis, rheumatoid arthritis, scleroderma, mycotic and viral infections, bone and cartilage diseases, neurological conditions/diseases such as Alzheimer's disease, amyotrophic lateral sclerosis (ALS), motor neurone disease, multiple sclerosis or autism, lung disease, osteoarthritis, polyposis coli, bone density and vascular defects in the eye (Osteoporosis-pseudoglioma Syndrome, OPPG), familial exudative vitreoretinopathy, retinal angiogenesis, early coronary disease, tetra-amelia, Müllerian-duct regression and virilization, SERKAL syndrome, type II diabetes, Fuhrmann syndrome, Al-Awadi/Raas-Rothschild/Schinzel phocomelia syndrome, odonto-onycho-dermal dysplasia, obesity, split-hand/foot malformation, caudal duplication, tooth agenesis, Wilms tumor, skeletal dysplasia, focal dermal hypoplasia, autosomal recessive anonychia, neural tube defects, alpha-thalassemia (ATRX) syndrome, fragile X syndrome, ICF syndrome, Angelman's syndrome, Prader-Willi syndrome, Beckwith-Wiedemann Syndrome, Norrie disease and Rett syndrome.

[00322] Compounds and compositions described herein can inhibit the kinase activity of, for example, CDK/cyclin complexes, such as those active in the G₀ or G₁ stage of the cell cycle, e.g., CDK2, CDK4, and/or CDK6 complexes.

Evaluation of Biological Activity

[00323] The biological activity of the compounds described herein can be tested using any suitable assay known to those of skill in the art, e.g., WO 2001/053268 or WO 2005/009997. For example, the activity of a compound may be tested using one or more of the test methods outlined below.

[00324] In one example, tumor cells may be screened for Wnt independent growth. In such a method, tumor cells of interest are contacted with a compound (i.e.

inhibitor) of interest, and the proliferation of the cells, e.g. by uptake of tritiated thymidine, is monitored. In some embodiments, tumor cells may be isolated from a candidate patient who has been screened for the presence of a cancer that is associated with a mutation in the Wnt signaling pathway. Candidate cancers include, without limitation, those listed above.

[00325] In another example, one may utilize *in vitro* assays for Wnt biological activity, e.g. stabilization of β -catenin and promoting growth of stem cells. Assays for biological activity of Wnt include stabilization of β -catenin, which can be measured, for example, by serial dilutions of a candidate inhibitor composition. An exemplary assay for Wnt biological activity contacts a Wnt composition in the presence of a candidate inhibitor with cells, e.g. mouse L cells. The cells are cultured for a period of time sufficient to stabilize β -catenin, usually at least about 1 hour, and lysed. The cell lysate is resolved by SDS PAGE, then transferred to nitrocellulose and probed with antibodies specific for β -catenin.

[00326] In a further example, the activity of a candidate compound can be measured in a *Xenopus* secondary axis bioassay (Leyns, L. *et al. Cell* (1997), 88(6), 747-756).

[00327] To further illustrate this invention, the following examples are included. The examples should not, of course, be construed as specifically limiting the invention. Variations of these examples within the scope of the claims are within the purview of one skilled in the art and are considered to fall within the scope of the invention as described, and claimed herein. The reader will recognize that the skilled artisan, armed with the present disclosure, and skill in the art is able to prepare and use the invention without exhaustive examples.

These include reduction of carbonyl compounds to their corresponding alcohols, oxidations, acylations, aromatic substitutions, both electrophilic and nucleophilic, etherifications, esterification and saponification and the like. These manipulations are discussed in standard texts such as *March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure* 7th Ed., John Wiley & Sons (2013), Carey and Sundberg, *Advanced Organic Chemistry* 5th Ed., Springer (2007), *Comprehensive Organic Transformations: A Guide to Functional Group Transformations*, 2nd Ed., John Wiley & Sons (1999) (incorporated herein by reference in its entirety) and the like.

General procedures

[00335] Compounds of Formula I of the present invention can be prepared as depicted in Scheme 1.

Scheme 1

[00336] Scheme 1 describes a method for preparation of indazole derivatives (**VIII**) by first reacting 5-iodo-1-(tetrahydro-2H-pyran-2-yl)-1H-indazole-3-carbaldehyde (**II**) with bis(pinacolato)diboron to form the borate ester (**III**). Suzuki coupling with various bromides (**IV**) yields indazole derivatives (**V**). Aldehyde (**V**) is reacted with various 1,2-diamines (**VI**) to produce (**VII**). Final deprotection of the pyrazole nitrogen yields the desired indazole derivatives (**VIII**).

[00337] Alternatively, compounds of Formula I of the present invention can be prepared as depicted in Scheme 2.

Scheme 2

[00338] Scheme 2 describes an alternative method for preparation of indazole derivatives (**VIII**) by first formylating 5-bromo-1H-indole (**IX**) to produce 5-bromo-1H-indazole-3-carbaldehyde (**X**) followed by protection with either SEM-Cl or DHP to give the protected aldehyde (**XI**). Aldehyde (**XI**) is then reacted with bis(pinacolato)diboron to form the borate ester (**XII**). Suzuki coupling with various bromides (**IV**) yields indazole derivatives (**XIII**). Aldehyde (**XIII**) is reacted with various 1,2-diamines (**VI**) to produce (**XIV**). Final deprotection of the pyrazole nitrogen yields the desired indazole derivatives (**VIII**).

Illustrative Compound Examples

[00339] Preparation of intermediate (II) is depicted below in Scheme 3.

Scheme 3

Step 1

[00340] 1H-indazole-3-carboxylic acid (XV) (100 g, 617 mmol) in DMF was treated with carbonyldiimidazole (110 g, 678 mmol) at room temperature until the evolution of gas ceased (ca. 15 minutes). The reaction was heated to 60-65°C for two hours and then allowed to cool to room temperature. N,O-Dimethylhydroxylamine-HCl (66.2 g, 678 mmol) was added as a solid and the mixture was heated to 65°C for 3 hours. The reaction was concentrated to a paste and taken up in DCM, and washed subsequently with water and 2N HCl. The product could be seen coming out of solution. The solid was filtered and rinsed separately with EtOAc. The EtOAc and DCM layers were separately washed with sodium bicarbonate followed by brine, dried over MgSO₄ and concentrated under reduced pressure. The resulting solids were combined, triturated with 1:1 mixture of DCM-ether, filtered, and dried to produce N-methoxy-N-methyl-1H-indazole-3-carboxamide (XVI) as a white solid (100 g, 487 mmol, 79% yield). ¹H NMR (DMSO-d₆) δ ppm 3.46 (s, 3H), 3.69-3.85 (m, 3H), 7.13-7.31 (m, 1H), 7.41 (t, J=7.25

Step 2

[00341] To the N-methoxy-N-methyl-1H-indazole-3-carboxamide (XVI) (20 g, 97.4 mmol) in DCM (1 L) was added bis(trifluoroacetoxy)iodobenzene (46 g, 107 mmol) followed by portionwise addition of iodine (14.84 g, 58.5 mmol) at room temperature. After 1 hour, 600 mL of saturated $NaHSO_3$ was added and a solid began to precipitate which was filtered and rinsed with excess DCM. The filtrate was washed with brine, dried over $MgSO_4$, concentrated and the remaining solid was triturated with a minimal amount of DCM. The combined solids were dried under vacuum over KOH to produce 5-iodo-N-methoxy-N-methyl-1H-indazole-3-carboxamide (XVII) as a white solid (23.2 g, 70 mmol, 72% yield). ^1H NMR ($DMSO-d_6$) δ ppm 3.45 (s, 4H), 3.77 (s, 4H), 7.45-7.54 (m, 1H), 7.66 (dd, $J=8.81, 1.51$ Hz, 1H), 8.40 (d, $J=1.01$ Hz, 1H); ESIMS found for $C_{10}H_{10}IN_3O_2$ m/z 331 (M+H).

Example 1.

[00418] Preparation of compound (1) is depicted below in Scheme 16.

Scheme 16

Step 1-2

[00419] A solution of 5-iodo-1-(tetrahydro-2H-pyran-2-yl)-1H-indazole-3-carbaldehyde (**II**) (498 mg, 1.4 mmol), bis(pinacolato)diboron (426 mg, 1.6 mmol), KOAc (412 mg, 4.2 mmol) and dry DMF (10 mL) was purged with nitrogen. Pd(dppf)₂Cl₂ (68 mg, 0.08 mmol) was added to the reaction and purged again with nitrogen. The solution was heated at 90°C for 2 h. Once TLC showed the disappearance of (**II**), the solution was cooled to room temperature. To this solution was added K₃PO₄ (446 mg, 2.1 mmol), N-(5-bromopyridin-3-yl)-3-methylbutanamide (**XXVIII**) (358 mg, 1.4 mmol), Pd(PPh₃)₄ (48 mg, 0.042 mmol) and water (2 mL). The solution was purged with nitrogen and heated at 90°C for 4 h. The reaction was passed through a pad of Celite® and then concentrated under reduced pressure. The residue was suspended in water, sonicated, filtered and dried. The crude product was purified on a silica gel column (100% DCM → 3:97 MeOH:DCM) to give N-(5-(3-formyl-1-(tetrahydro-2H-pyran-2-yl)-1H-indazol-5-yl)pyridin-3-yl)-3-methylbutanamide (**LXXXIV**) as an off white solid (239 mg, 0.59 mmol, 42% yield). ¹H NMR (DMSO-d₆, 500 MHz) δ ppm 0.96 (d, 6H), 1.60-1.67 (m, 1H), 1.75-1.84 (m, 1H), 2.05-2.15 (m, 3H), 2.26 (d, 2H), 2.39-2.47 (m, 1H), 3.80-3.86 (m, 1H), 3.89-3.93 (m, 1H), 6.13 (dd, 1H), 7.91 (dd, 1H), 8.06 (d, 1H), 8.36 (s, 1H), 8.39 (s, 1H), 8.63 (d, 1H), 8.81 (d, 1H), 10.23 (s, 1H); ESIMS found C₂₃H₂₆N₄O₃ *m/z* 407.3 (M+H).

Step 3-4

[00420] A solution of N-(5-(3-formyl-1-(tetrahydro-2H-pyran-2-yl)-1H-indazol-5-yl)pyridin-3-yl)-3-methylbutanamide (**LXXXIV**) (52 mg, 0.127 mmol), 5-(4-methylpiperazin-1-yl)pyridine-3,4-diamine (**LVIII**) (29 mg, 0.13 mmol) and sulfur (45 mg, 0.13 mmol) in dry DMF (10 mL) was heated at 140°C overnight. The reaction was cooled and evaporated under vacuum. The viscous residue was dried overnight under vacuum. The solid was washed with cold water and dried under vacuum. The crude product (**LXXXV**) was dissolved in DCM (5 mL) followed by Et₃SiH (48 μL, 0.30 mmol) and slowly addition of TFA (2.5 mL). The reaction was stirred until TLC (10% MeOH/DCM) showed the reaction was complete. The reaction was evaporated under vacuum and the residue was treated with water, sonicated and then basified with aq.

ammonia. The solids were filtered, washed with cold water and dried. The crude product was heated in EtOAc and filtered hot to remove impurities. The hot EtOAc solution was allowed to slowly cool to room temperature and filtered to give 3-methyl-N-(5-(3-(7-(4-methylpiperazin-1-yl)-3H-imidazo[4,5-c]pyridin-2-yl)-1H-indazol-5-yl)pyridin-3-yl)butanamide **1** as a pink solid (36 mg, 0.071 mmol, 59% yield). ^1H NMR (DMSO- d_6 , 500 MHz) δ ppm 0.97 (d, 6H), 2.13 (m, 1H), 2.27 (m, 4H), 3.45 (m, 4H), 6.70 (s, 1H), 7.79 (dd, 2H), 8.36 (s, 1H), 8.62 (s, 1H), 8.65 (s, 1H), 8.66 (s, 1H), 8.84 (s, 1H), 10.26 (s, 1H), 12.97 (s, 1H), 13.82 (s, 1H); ESIMS found for $\text{C}_{28}\text{H}_{31}\text{N}_9\text{O}$ m/z 510.5 (M+H).

Example 2.

[00572] The above synthesized compounds were screened using the assay procedure for Wnt activity described below.

[00573] Reporter cell lines can be generated by stably transducing cells of cancer cell lines (e.g., colon cancer) with a lentiviral construct that include a wnt-responsive promoter driving expression of the firefly luciferase gene.

[00574] Lentiviral constructs can be made in which the SP5 promoter, a promoter having eight TCF/LEF binding sites derived from the SP5 promoter, is linked upstream of the firefly luciferase gene. The lentiviral constructs can also include a hygromycin resistance gene as a selectable marker. The SP5 promoter construct can be used to transduce SW480 cells, a colon cancer cell line having a mutated APC gene that generates a truncated APC protein, leading to de-regulated accumulation of β -catenin. A control cell line can be generated using another lentiviral construct containing the luciferase gene under the control of the SV40 promoter which does not require β -catenin for activation.

[00575] Cultured SW480 cells bearing a reporter construct can be distributed at approximately 10,000 cells per well into 384 well multiwell plates. Compounds from a small molecule compound library can then be added to the wells in half-log dilutions using a three micromolar top concentration. A series of control wells for each cell type receive only buffer and compound solvent. Twenty-four hours after the addition of compound, reporter activity for luciferases can be assayed, for example, by addition of the BrightGlo luminescence reagent (Promega) and the Victor3 plate reader (Perkin Elmer). Readings can be normalized to DMSO only treated cells, and normalized activities can then be used in the IC₅₀ calculations. Table 2 shows the activity of selected indazole analogs.

[00578] Preparation of a 220 µg/mL suspension in 0.5% CMC/0.05% tween 80 begins by dispensing 597 g ± 1 g of Gibco 1X PBS into the 1 L glass bottle. Using a 1 mL sterile syringe, measure 0.3 mL of Tween 80. In a weigh boat, weigh out 3 g ± 0.1 g of Carboxymethyl Cellulose 7LXF PH (CMC). Start mixing the Tween80/PBS solution and slowly sprinkle the CMC into the 1 L bottle containing the PBS/Tween mixture (increase mixing speed as necessary). Once visually dispersed and the polymer is hydrated, start heating the container on a heating plate to promote phase inversion (turbidity). Once the solution is cool to the touch, filter NLT 120 mL into the 250 mL glass bottle. Weigh 27 mg of a compound of Formula I and suspend by mixing with the aid of 120 g of the sterile filtered CMC/tween solution. Fill 2 mL schott glass vials and 13 mm Flurotec coated stoppers (West Pharma) and autoclave the vials at 260°F for NLT 25 minutes. Particle size measurement (Table 4) was performed after autoclaving using a Horiba L-950.

[00589] Weigh 100 mg of a compound of Formula I (or its salt) and add slowly while mixing to 100 mL of solution of 1.5% dextrose (or lactose) + 0.05% tyloxapol. The final solution is sterile filter the solution using a millex GP syringe filter.

[00590] Administration is performed using a jet nebulizer (Pari LC plus) or an aerodose nebulizer.

[00591] C57/Bl6 mice were dosed for 30 minutes via a nose only chamber (CH technology) at a flow rate of 15 LPM, particle size distribution and dose was measured by a 7 stage impactor (1 LPM) placed in one of the ports. A median aerosol particle size of 1.2 μ m with a GSD of 1.8 μ m was obtained and a dosing rate of 1.8 μ M/min/mouse.

[00592] A diluted formulation of 0.5 mg/mL of compound of Formula I was nebulized for 10 and 30 minutes to C57/bl6 mice (animals with bleomycin induced pulmonary fibrosis via the administration of bleomycin via intratracheal administration), the compound of Formula I was delivered via a nose only chamber (CH technology) at a flow rate of 20 LPM daily for 14 days. At the end of the 14 days, the animals were tested for MMP-7 levels and the lungs were scored using the Ashcroft scoring system to evaluate pulmonary fibrosis.
