MULTIFUNCTIONAL PAN LID

ABSTRACT

A multifunctional pan lid covered onto a pan includes a top, a lid body with an opening, and a top cover combined with the top of the opening and having a grip on a top surface of the lid cover. The lid body has a positioning edge disposed around the inner periphery of the opening, and at least one set of a snap portion and a snap member disposed between the periphery of the top cover and the positioning edge that can be engaged with or released from each other. When the pan contains hot oil for frying food, the top cover can be removed, and the lid body can stop hot oil from splashing around, avoid people from being burned by oil explosion or cause the kitchen to be greasy and dirty, while allowing moisture and oil fume to be released from the opening. When the top cover is combined with the lid body to cover the opening, the pan lid can be used in a general way to simmer food or facilitate user to access the pan lid, so as to provide a multifunctional use.
