CONNECTING AND FIXING STRUCTURE OF FUNNEL CHEST CORRECTION PLATE

ABSTRACT OF THE DISCLOSURE

A connecting and fixing structure of a funnel chest correction plate includes a fixing plate, a stop limiting portion, a fixing groove, free ends, an opening end, a clamp limiting portion, an open end, a fixing portion, a correction plate, an adjusting hole, and a fastening member. To combine the correction plate and the fixing plate, the correction plate is directly placed, through the open end of the fixing plate, on the fixing plate and entering through the opening end into the fixing groove, so that the stop limiting portion and the clamp limiting portion temporarily hold the correction plate and the fixing plate lying flat on each other. Then, the position of the correction plate is adjusted through the free ends to have the adjusting hole and the fixing portion aligned with each other. The fastening member sets the correction plate on the fixing plate in a movable manner.
