

Abstract

Embodiments of the present application relate to the technical field of computers, and provides a method and an apparatus for node speed limiting, an electronic device and a storage medium. The method comprises: receiving bandwidth data reported by a node under a target domain name, wherein the bandwidth data comprises the number of node connections and a node bandwidth, and the number of node connections is the number of connected devices in the node; and calculating a bandwidth quota for the node based on the bandwidth data and a quota upper limit for the target domain name. By using the present application, the bandwidth quota for each node under the target domain name can be allocated more accurately.
