

ABSTRACT

5 A plating rack includes a linking-up frame having one end to couple
a first hanging frame, a support frame located oppositely to the
linking-up frame and having one end to couple a second hanging frame,
a pair of parallel extendable frames extending to bridge ends of the first
hanging frame and the second hanging frame, and a plurality of first
clamp members for holding a substrate. The first clamp members
extending individually toward the substrate are distributed to both the
10 hanging frames. The first clamp member has a pair of lever arms for
clamping the substrate, in which the lever arm has at least one holder for
contacting the substrate. Further, a first liquid stopper at the lever arm
is to encircle the holder in an annular-setting manner, such that an
enclosed region is formed between the holder and the first liquid stopper.
