

ABSTRACT

In order to prevent a fixing member from falling off, a knob falling-off prevention member switches between a state of making a knob detachable from a lens barrel body and a state of making the knob non-detachable from the lens barrel body. Further, the knob may be a falling-off prevention screw including a first body portion that is threaded, a second body portion having a smaller diameter than that of the first body portion and is not threaded, and a diameter that is larger than that of the second body portion and is equal to or smaller than that of the first body portion. Furthermore, an operation member may include a screw hole that can be screwed by the first body portion of the knob, and the knob falling-off prevention member may include a keyhole formed by communicating a hole through which a third body portion of the knob can be inserted and a hole through which the third body portion cannot be inserted.
