

ABSTRACT

The present disclosure belongs to the technical field of communications. Provided are a method and apparatus for determining a random access resource configuration, and a user equipment, an RIS array, a network-side device and a storage medium. The method comprises: in response to a UE triggering a random access process, determining a usage rule of random access resource configurations; and determining a random access resource configuration on the basis of the determined usage rule, and performing random access on the basis of the determined random access resource configuration. By means of the method for determining a random access resource configuration provided in the present disclosure, a network-side device and a UE can keep a random access resource configuration consistent on the basis of a usage rule, thereby improving the stability of a random access process.
