Cyclic Amine Derivative Having Heteroaryl Ring

[Technical Field]

The present invention relates to compounds which exhibit activity in the inhibition of platelet aggregation, pharmacologically acceptable salts thereof and prodrugs thereof.

[Background of the Invention]

Recently, the number of patients with cardiovascular diseases associated with aging of the population and changes of eating habits and lifestyle has risen markedly. Since thrombotic diseases such as cerebral infarction, myocardial infarction and peripheral circulatory disorders have not only high morbidity but also result in poor prognosis and limitation on activities of daily living, patients with these disorders have an undue burden of personal and social disability. It is well known that the direct causes of these diseases are angiostenosis caused by thrombus induced by platelet activation (adhesion to damaged areas of blood vessels, release of physiologically active substances, clot formation, and so on) and ischemia associated with angiostenosis. Thus, antithrombotic agents that inhibit platelet activation play important roles in preventing the occurrence and recurrence of these diseases as well as in their treatment. Furthermore, these agents are considered to become more and more important in the future as the number of patients with thrombotic diseases increases.

Several biological substances related to platelet aggregation, such as adenosine 5'-diphosphate (ADP), thromboxane A_2 (TXA_2), collagen, serotonin (5-HT) and the like, are known. Moreover, $P2Y_1$ and $P2Y_{12}$ receptors are known as ADP receptors. Some existing antithrombotic agents act by exerting antagonistic action against these receptors. Examples of such antithrombotic agents are ticlopidine and clopidogrel, which have thienopyridine structures.

In addition, compounds as described in WO98/08811 or WO99/43648

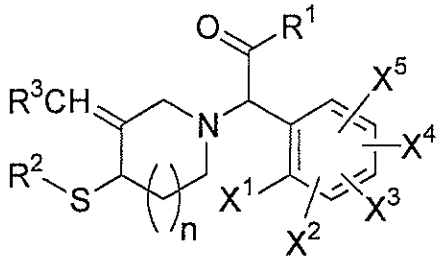

are known as compounds having non-thienopyridine structures and antagonistic action against ADP receptors. However, there are certain problems in that these compounds are chemically unstable or only weakly active.

[Disclosure of the Invention]

To create novel antithrombotic agents, the present inventors have diligently explored chemically stable compounds having non-thienopyridine structures and activity in the inhibition of platelet aggregation, and found that compounds having the general formula (I) of the present invention, pharmacologically acceptable salts thereof and prodrugs thereof have desirable characteristics, and thus completed the present invention.

The present invention provides pharmaceutical compositions comprising compounds having the general formula (I), pharmacologically acceptable salts thereof and prodrugs thereof, as active ingredients (particularly pharmaceutical compositions for prophylactic or therapeutic agents for diseases related to thrombus or embolus formation), use of compounds having the general formula (I), pharmacologically acceptable salts thereof and prodrugs thereof to manufacture pharmaceutical compositions (particularly pharmaceutical compositions for prophylactic or therapeutic agents for diseases related to thrombus or embolus formation) and prophylactic or therapeutic methods for diseases (particularly diseases related to thrombus or embolus formation) by administration of compounds having the general formula (I), pharmacologically acceptable salts thereof and prodrugs thereof to warm-blooded animals (especially humans) at pharmacologically effective doses.

[Effect of the Invention]

The compounds of the present invention are chemically stable and exert excellent platelet anticoagulation activities and inhibiting action against thrombosis formation. Furthermore, the compounds of the present invention exert the said actions with short onset latencies and exhibit low toxicities. Thus, the compounds of the present invention may be useful in the prophylactic, prevention of recurrence, and therapeutic settings (particularly the latter) against diseases induced by platelet activation such as thrombosis formation and platelet coagulation and releasing responses of platelets, for example in percutaneous coronary intervention (PCI), angioplasty, endarterectomy, restenosis after stenting, acute coronary syndrome, stable and unstable angina, myocardial infarction, atrial fibrillation, cerebral ischemic attack, cerebral infarction, and atherosclerosis and diseases induced by thrombosis formation or embolus formation that are associated with diabetes mellitus, peripheral arterial disease, heparin-induced thrombocytopenia (HIT), thrombotic thrombocytopenic purpura (TTP), antiphospholipid antibody syndrome, venous thrombosis, and ichorrhemia.

[Best Mode for Carrying out the Invention]

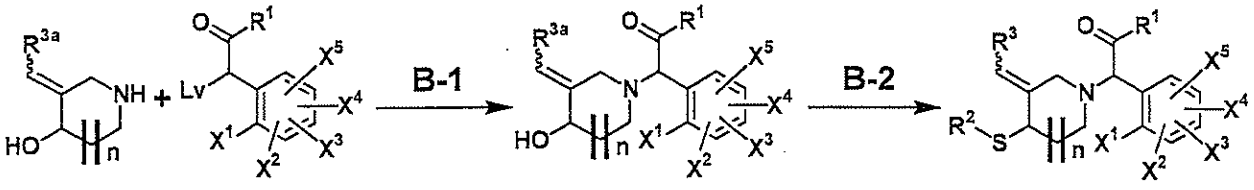

The compound (I) in the present invention can be obtained by Process A or Process B described below.

Process A

(II) (III) (I)

Process B

(IV) (III) (V) (I)

In the above, from R^1 to R^3 and from X^1 to X^5 have the same meanings as defined above; R^{2a} represents R^2 described above or a protective group for a mercapto group; R^{3a} represents R^3 described above or a group by which an amino group on R^3 may be protected, if necessary, by a protective group for an amino group; and Lv represents a leaving group.

The protective group for a mercapto group of R^{2a} can be the same group as that described as the protective group for a mercapto group of the above "prodrug", and is preferably an acetyl group.

The protective group for an amino group of R^{3a} is not particularly restricted provided that it can usually protect an amino group in chemical reactions, and specifically indicates a protective group that can be cleaved by a chemical process such as hydrogenolysis, hydrolysis, electrolysis and photolysis. Such protective group can be, for example, the above "aliphatic acyl group"; the above "aromatic acyl group"; the above "alkoxycarbonyl group"; the above "aralkyloxycarbonyl group"; the above "silyl group"; the above "aralkyl group"; a "substituted methylene group" that can form a Schiff base such as N,N-dimethylaminomethylene, benzylidene, 4-methoxybenzylidene, 4-nitrobenzylidene, salicylidene, 5-chlorosalicylidene, diphenylmethylene or (5-chloro-2-hydroxyphenyl)phenylmethylene group; an "aromatic

sulfonyl group" consisting of: an arylsulfonyl group such as a benzenesulfonyl group, and an arylsulfonyl group substituted with lower alkyl or lower alkoxy group(s) such as a p-toluenesulfonyl, pentamethylbenzenesulfonyl, p-methoxybenzenesulfonyl, 2,4,6-trimethoxybenzenesulfonyl or 3-methoxy-4-t-butylbenzenesulfonyl group; and an "aliphatic sulfonyl group", including an alkylsulfonyl group such as a methanesulfonyl or t-butylsulfonyl group, and an alkylsulfonyl group substituted with halogen atom(s), silyl group(s), or aryl group(s) such as a trifluoromethylsulfonyl, trisilylethanesulfonyl or benzylsulfonyl group.

The leaving group of Lv is not particularly restricted provided that this group is a functional group that can achieve displacement reaction by reacting with a nucleophilic substituent, and can be, for example, the above "halogen atom" described hereinbefore; a "lower alkylsulfonyloxy group" such as a methanesulfonyloxy or ethanesulfonyloxy group; a "halogenated lower alkylsulfonyloxy group" such as trifluoromethanesulfonyloxy group; or an "aromatic sulfonyloxy group", including an arylsulfonyloxy group such as a benzenesulfonyloxy group, a lower alkylated arylsulfonyloxy group such as a p-toluenesulfonyloxy group, a halogenated arylsulfonyloxy group such as a p-chlorobenzenesulfonyloxy group and a nitrated arylsulfonyloxy group such as a p-nitrobenzenesulfonyloxy group.

Each step of Process A and Process B is hereinafter described in detail.

(Process A)

Process A is a step for the preparation of compound (I) by conducting a nucleophilic displacement reaction in the presence of a base using compound (II) obtainable by Process C and compound (III) that is well known or easily prepared from known compounds (Step A-1). Furthermore, if necessary, several reactions such as deprotection of a protective group of a mercapto group (Step A-2), introduction of a substituent onto a mercapto group (Step A-3), hydrolysis of an ester group (Step A-4), conversion of a carboxyl group into an amide

group (Step A-5), conversion of a carboxyl group into an ester group (Step A-6), deprotection of a protective group for an amino group (Step A-7) and conversion of a carboxyl group into a hydroxyamino group (Step A-8) can also be carried out. The steps from A-2 to A-8 can be conducted either before or after the step A-1, and the order of these steps can easily be selected according to circumstances by a person having ordinary skill in the art.

(E)-3-([1H-Pyrazol-3(5)-yl]methylidene)-1-(triphenylmethyl)piperidin-4-one (Example 73-(a), 40.6 g) was portioned between two flasks for the reaction. To solutions of the compound in N,N-dimethylformamide (420 ml, total amount of the two flasks) were added ethyl bromoacetate (53.9 ml, total amount of the two flasks), potassium carbonate (33.4 g, total amount of the two flasks) and potassium iodide (80.3 g, total amount of the two flasks) under ice-cooling. The mixtures were stirred at room temperature for 0.5 hour and then at 80°C for 0.5 hour. Water and ethyl acetate were added to reaction mixtures, which was then combined, and the layers were separated. The organic layer was washed successively with water and a saturated aqueous sodium chloride solution and dried over anhydrous magnesium sulfate. The solvent was removed under reduced pressure and the residue was purified by silica gel chromatography (eluent: hexane/ethyl acetate/dichloromethane=2/2/1) to afford (E)-3-{[1-(ethoxycarbonyl)-1H-pyrazol-3-yl]methylidene}-1-(triphenylmethyl)piperidin-4-one (49 g, containing a small amount of the regioisomer regarding the position on the pyrazole ring) as a yellow solid. (a) (E)- and (Z)-4-(Acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-pyrazol-3-yl]methylidene}piperidine hydrogen trifluoroacetate

Following a procedure similar to that described in Example 75-(a) and (b), the use of ethyl bromoacetate, instead of t-butyl bromoacetate, afforded (E)-4-(acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-pyrazol-3-yl]methylidene}-1-(triphenylmethyl)piperidine. To a solution of this compound (18.02 g) in dimethyl sulfoxide (150 ml) was added potassium thioacetate (36.4 g). After the mixture was stirred at 80°C for 5 hours, it was cooled, and products were extracted by ethyl acetate. After the organic layer was washed with an aqueous sodium chloride solution and dried over anhydrous magnesium sulfate, it was concentrated under reduced pressure. The residue was purified by silica gel column chromatography using hexane and ethyl acetate (3 : 2) as an eluent to afford 4-(acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-pyrazol-3-yl]methylidene}-1-(triphenylmethyl)piperidine (11.7 g, yield:65%) as a mixture of geometric isomers as a brown oil.

The above obtained mixture (11 g) was dissolved in dichloromethane (100 ml) and trifluoroacetic acid (4.43 ml) was added thereto. After the mixture was stirred at room temperature for 1 hour, solvents were evaporated under reduced pressure. The residue was subjected to silica gel chromatography (dichloromethane/methanol = 10/1) to afford the less polar isomer, (E)-4-(acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-pyrazol-3-yl]methylidene}piperidine

After the mixture was stirred at room temperature for 2 hours, the product was extracted with ethyl acetate. The organic layer was washed with a saturated aqueous sodium chloride solution and dried over anhydrous magnesium sulfate. The extract was concentrated under reduced pressure and the residue was purified by silica gel chromatography using hexane and ethyl acetate (1 : 1) as an eluent to give 1-(t-butoxycarbonyl)-1H-1,2,4-triazole-3-carbaldehyde (10.26 g).

Pyrrolidine (4.3 ml) was added to a solution of 1-(triphenylmethyl)piperidin-4-one (17.7 g) in benzene (500 ml). The mixture was heated under reflux for 3 hours removing water using a Dean-Staak apparatus. The mixture was cooled to room temperature, and 1-(t-butoxycarbonyl)-1H-1,2,4-triazole-3-carbaldehyde (10.2 g) was added. After the mixture was heated for 3 further hours under reflux, it was cooled, then water was added, and products were extracted with ethyl acetate. After concentration under reduced pressure, the residue was treated with methanol (200 ml) at room temperature for 30 minutes. The solution was partitioned between water and ethyl acetate, and the organic layer was washed with a saturated aqueous sodium chloride solution and then dried over anhydrous magnesium sulfate. Concentration under reduced pressure gave a residue, which was purified by silica gel chromatography using hexane, ethyl acetate, and dichloromethane (1 : 2 : 1) as an eluent to give the title compound (2.92 g, yield: 13%) as a yellow amorphous solid.

The mixture was stirred at 80°C for 4 hours. After cooling to room temperature, the mixture was diluted with ethyl acetate, and washed successively with water and a saturated aqueous sodium chloride solution. After the extract was dried over anhydrous sodium sulfate, it was concentrated under reduced pressure, and the residue was purified by silica gel chromatography using ethyl acetate and hexane (1 : 9 to 2 : 3) as eluents to afford a crude product of 4-(acetylsulfanyl)-3-({1-[2-(ethoxycarbonyl)ethyl]-1H-pyrazol-3-yl}methylidene)-1-(triphenylmethyl)piperidine (2.93 g) as a mixture of geometric isomers.

Trifluoroacetic acid (1.2 ml) was added to a solution of the crude product obtained above in dichloromethane (25 ml). After being stirred at room temperature for 1 hour, the mixture was concentrated under reduced pressure and the residue was purified by silica gel chromatography using dichloromethane and ethanol (99 : 1 to 4 : 1) as eluents. (Exemplification Compound No. 4-88)
(a) (Z)-4-(Acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-imidazol-5-yl]methylidene}piperidine bis(hydrogen trifluoroacetate)

To a solution of (E)-3-{[1-(ethoxycarbonylmethyl)-1H-imidazol-

5-yl]methylidene}-1-(triphenylmethyl)piperidin-4-ol (3.15 g) in toluene (50 ml) were added N,N-dimethylformamide dineopentyl acetal (3.5 ml) and thioacetic acid (0.89 ml) at room temperature. After being stirred at room temperature for 1 hour, the mixture was diluted with ethyl acetate, washed successively with water and a saturated aqueous sodium chloride solution and dried over anhydrous sodium sulfate. Removal of the solvent under reduced pressure followed by purification of the residue by silica gel chromatography using ethyl acetate and hexane (1 : 4 to 1 : 0) as eluents gave crude (E)-4-(acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-imidazol-5-yl]methylidene}-1-(triphenylmethyl)piperidine (3.29 g) as a yellow amorphous solid.

The product thus obtained was dissolved in dimethyl sulfoxide (50 ml) and potassium thioacetate (6.56 g) was added. The mixture was stirred at 80°C for 4 hours. After cooling, the mixture was partitioned between water and ethyl acetate. The organic layer was separated, washed with a saturated aqueous sodium chloride solution and dried over anhydrous sodium sulfate. Removal of the solvent under reduced pressure followed by purification of the residue by silica gel chromatography (eluent: ethyl acetate/ hexane =1/1~1/0) gave an approximately 1:1 mixture of (Z)-4-(acetylsulfanyl)-3-{[1-(ethoxycarbonylmethyl)-1H-imidazol-5-yl]methylidene}-1-(triphenylmethyl)piperidine and its (E)-isomer (2.73 g).

Trifluoroacetic acid (1.1 ml) was added to a solution of the mixture obtained above in dichloromethane (40 ml) at 0°C. After being stirred at room temperature for 15 minutes, the mixture was concentrated under reduced pressure and the residue was purified by silica gel chromatography (eluent: methanol/dichloromethane = 5/95~25/75) to afford the title compound (1.44 g, overall yield: 54%) as a pale yellow oil.

(Exemplification Compound No. 1-213)
(a) Ethyl 5-formyl-1-(4-methoxybenzyl)-1H-1,2,3-triazole-4-carboxylate, and ethyl 4-formyl-1-(4-methoxybenzyl)-1H-1,2,3-triazole-5-carboxylate

To a solution of trimethyl(prop-2-ynyloxy)silane (15 ml) in tetrahydrofuran (100 ml) was added butyllithium (2.6 M in hexane, 38 ml) at -78°C. The resulting mixture was stirred at the same temperature for 0.5 hour, and ethyl chloroformate (10 ml) was added thereto. The resulting mixture was stirred at -78°C for 1.5 hours, and poured into ice water. The resulting materials were extracted with ethyl acetate. The organic layer was washed with water and saturated aqueous sodium chloride solution successively. The extract was dried over anhydrous sodium sulfate, and the solvents were evaporated in vacuo to afford ethyl 4-(trimethylsilyloxy)but-2-ynoate (16.5 g).

A solution of the above compound (16.5 g) and 4-methoxybenzyl azide in toluene (200 ml) was stirred at 120°C for 8 hours. When the reaction mixture was cooled to room temperature, tetrabutylammonium fluoride (1.0 M in tetrahydrofuran) was added to the mixture, and

the resulting mixture was stirred at room temperature for 0.5 hour. The mixture was partitioned between water and ethyl acetate. The separated organic layer was washed with water and saturated aqueous sodium chloride solution successively, dried over anhydrous sodium sulfate. Solvents were evaporated in vacuo to afford a mixture of ethyl 5-(hydroxymethyl)-1-(4-methoxybenzyl)-1H-1,2,3-triazole-4-carboxylate and ethyl 4-(hydroxymethyl)-1-(4-methoxybenzyl)-1H-1,2,3-triazole-5-carboxylate (25 g) as a brown oil.

The above-described crude product (26 g, including the product similarly obtained in another study) was dissolved in dichloromethane (500 ml), and molecular sieves 4A (50 g) was added thereto. While the mixture was being stirred at 20°C, pyridinium dichromate (47 g) was added over a period of 30 minutes. The resulting mixture was stirred at room temperature for 1.5 hours, and filtrated. The precipitate was washed with dichloromethane. The filtrate and the washing liquid were combined. Solvents were evaporated in vacuo, and the residue was purified by chromatography on silica gel using a mixture of dichloromethane and methanol (19 : 1) as the eluent to afford a mixture of the two title compounds as a brown oil. The mixture was purified again by chromatography on silica gel to obtain the less polar isomer of the two title compounds as a yellow oil (10.9 g).

(Test Example 1) Confirmation of inhibitory activities of test compounds against platelet coagulation *in vitro*.

Three to four male Sprague-Dawley rats (8 weeks of age, Japan SLC., Inc.) per group were used in the present test. Platelet coagulation was determined by platelet aggregometer (MCM Hema Tracer 313M, MC Medical, Inc.) according to modified methods described by Born et al. (Journal of Physiology, vol. 168, 178 (1963)). Blood (6.3 ml) was collected from abdominal aorta of rats anesthetized with pentobarbital sodium (40 mg/kg) with a microsyringe containing 0.7 ml of sodium citrate at a concentration of 3.8% as anti-coagulant. The obtained blood containing sodium citrate was centrifuged (230 x g for 15 min at room temperature) and plate-rich plasma (hereinafter referred to as PRP) fraction was isolated. Furthermore, after PRP was isolated, the blood was further centrifuged (2,000 x g for 10 min at room temperature) and platelet-poor plasma (hereinafter referred to as PPP) fraction was isolated. Platelet count in PRP was determined by automated hematology analyzer (KX-21N, SYSMEX CORPORATION) and adjusted as 5×10^8/ml. After PRP (239 μl) was put into each cuvette, the test substance dissolved in dimethyl sulfoxide (DMSO, 1 μl) was added to the PRP solution and assessed by automated hematology analyzer. In the control group, DMSO solution (1 μl) instead of the test substance solution was added to the PRP solution. After warming at 37°C for 1.5 min, 10 μl of adenosine-5'-diphosphate

(ADP) solution (final concentration: 10 μl) was added, and platelet coagulation was induced. Platelet coagulation was determined for 5 min and the maximum rate of plate coagulation determined. The results are shown in Table 7.
