

ABSTRACT

There is provided a chair-type massager (1) comprising: a seat part (2); an armrest part (7) disposed at each of the sides of the seat part (2); a backrest part (3) disposed on the rear of the seat part (2); a massage system disposed in at least one of the seat part (2), the armrest part (7), and the backrest part (3); and catching detection means (20). The armrest part (7) mounted on the seat part (2) moves from below upward in a reclining mode, and moves from above downward upon release of the reclining mode. The catching detection means (20) detects the occurrence of catching between the armrest part (7) and a floor surface (F) at the time of the release of the reclining mode.
