

ABSTRACT

PLASTIC DOOR FRAME AND METHOD OF MOUNTING THE SAME

A plastic door frame structure and a method of mounting the same after a threshold is installed in a door hole includes fixing a packing rail on a wall of the door hole, fitting an outer rail on the packing rail 1 and adjusting the horizontal or vertical position of the outer rail 2, arranging a link rail 3 at either lateral side of the outer rail such that the link rail conceals a clearance formed between the outer rail 2 and the wall and passing screws through the link rail and the outer rail into the packing rail to keep the outer rail firmly in place, and fitting a seal strip onto the link rail 3 to accomplish an integral plastic door frame, which is cut at 45 degrees at appropriate positions to obtain an inverted-U shaped door frame with the lateral sides perpendicular to the top side.
