

ABSTRACT

Disclosed are a method for multiplexing transmission of information and apparatus, a method for receiving information and apparatus, user equipment (UE), a base station and a computer-readable storage medium, wherein the method for multiplexing transmission of information includes: when a physical uplink control channel (PUCCH) and a plurality of physical uplink shared channels (PUSCHs) have an overlapping portion in a time-domain, selecting, based on a selection criterion, a PUSCH for multiplexing transmission of uplink control information (UCI) carried in the PUCCH; and using the selected PUSCH for the multiplexing transmission of the UCI and transmission content of the selected PUSCH. According to the embodiments of the present disclosure, when the PUCCH and the plurality of PUSCHs have an overlapping portion in the time-domain, a suitable PUSCH can be selected for the multiplexing transmission.
