

Description

This invention relates to 16 α -methyl steroids and their preparation.

16 α -Methyl corticoids, including dexamethasone, flumethasone and paramethasone, are known anti-inflammatory agents.

The transformation of 16-unsaturated pregnanes to 16 α -methyl pregnanes, using a Grignard reagent, is known. Conjugate addition to a 16-unsaturated-2-keto steroid, to form a 16 α -methyl- $\Delta^{17(20)}$ -20-enolate, using a methyl Grignard reagent in the presence of a copper salt catalyst, is described in "Organic Reactions in Steroid Chemistry", Vol. II, J. Fried and J. A. Edwards, Van Nostrand Reinhold Co., NY (1972) 75. The product may be trapped as the 20-acetate (see p.76). While the addition can give equal amounts of 1,2 and 1,4 products, the use of cuprous chloride gives exclusively 1,4-addition, in yields of greater than 90%.

US-A-3231568 discloses the transformation of a 16-unsaturated progesterone to the corresponding 17 α -hydroxy-16 α -methylprogesterone. The progesterone had no C₂₁ functionality and no C-ring substitution. Acetate is used for trapping.

US-A-4031080 discloses using copper for the conjugate addition reaction, to produce an enol acetate, in the preparation of a 17 α -bromo-16 α -methyl corticoid.

US-A-4277409 discloses transforming a 16-unsaturated-21-acetate to a 16 α -methyl-21-acetate, without introducing a 17 α -hydroxyl group.

GB-A-2001990 discloses transforming a 16-unsaturated corticoid to the corresponding 16 α -methyl corticoid, by methylation with a methyl Grignard reagent in the presence of a copper catalyst, to produce a 6 α -methyl- $\Delta^{17(20)}$ -20-(magnesium bromide)enolate, oxygenation to a 17 α -hydroperoxide, and reduction to the corresponding 16 α -methyl-17 α ,21-dihydroxy-20-one 21-acetate.

US-A-3072686 discloses the transformation of a 16-unsaturated progesterone to a 17 α -hydroxy-16 α -methyl-progesterone by reaction with a Grignard reagent and cuprous chloride, via a $\Delta^{17(20)}$ -20-enol acetate.

J.A.C.S. 80 (1958) 3160 and 4428 report the transformation of a 16-unsaturated progesterone to a 16 α -methylprogesterone, by reaction with a Grignard reagent followed by peracid oxidation, to produce a 17 α -hydroxy-16 α -methylprogesterone which is brominated and acylated to form a 21-acetoxy-17 α -hydroxy-16 α -methyl steroid.

US-A-3700660 discloses converting a 20-acyloxy-17,20-epoxy steroid to a 17 α -acyloxy-20-keto steroid, using a strong acid and a 20-acetate.

US-A-3513163 and US-A-4036831 respectively disclose C₂₁ and C₁₁ trimethylsiloxy ethers.

$\Delta^{17(20)}$ -20-O-Substituted steroids in which the substituent is an acyl group or a Grignard substituent (—Mg—X) are disclosed in US-A-3072686, US-A-3231568 and US-A-4031080. The Mg—X substituted compounds are not isolatable.

US-A-3876633 discloses 17 α ,20-epoxy-16 α -methyl-20-O-acyl steroids, selective epoxidation of the $\Delta^{9(11)}$ double bond in a $\Delta^{9(11),16}$ -diene, and 9 β ,11 β -epoxy- Δ^{16} -steroids in which the A-ring is reduced.

US-A-3210341 (Example 9b) discloses 9 β ,11 β -epoxy-6 α -fluoro-21-hydroxypregna-1,4,16-triene-3,20-dione 21-acetate.

US-A-4036831 discloses protecting the 11 β -hydroxyl group of a steroid with the trimethylsilyl group, and the removal of the trimethylsilyl group by hydrolysis with 40 to 60% aqueous hydrogen fluoride.

Helv. Chim. Acta 61 (1978) 3069—3070 describes the preparation of a 20-silyl ether steroid, as an intermediate for preparing a 17 α -substituted steroid.

Novel compounds according to the present invention are the $\Delta^{17(20)}$ -steroids of formulae IIA, IIB and IIC, the 17 α ,20-epoxides of formulae IIIA, IIIB and IIIC, and the 17 α -silyl ethers of formulae IVA, IVB and IVC.

A first process according to the invention, for the preparation of the $\Delta^{17(20)}$ -steroids comprises (1) reacting a 16-unsaturated corticoid (IA—C) with a methylating agent in the presence of a copper catalyst, and (2) contacting the product of step 1 with a silylating agent.

A second process according to the invention, for the preparation of the 17 α ,20-epoxides, comprises reacting a $\Delta^{17(20)}$ -steroid with a peracid.

The use of a peracid represents mild conditions. Such conditions would be unsatisfactory for reaction of the enol acetate described in US-A-3231568, US-A-4031080 or US-A-3072686, or for the 20-acetate of US-A-3700660. The known 20-acylate is non-functionalised, since otherwise it cannot be subjected to epoxidation, but the $\Delta^{17(20)}$ -20-enol silanes (II) of the present invention are much more reactive.

The products and processes of the invention will now be described with reference to the accompanying Charts. The 16-unsaturated corticoids (I) are known or can be readily prepared from known steroids by methods well known to those skilled in the art. See, for example, US Patents, 2,773,080, 2,864,834, 3,210,341, 3,441,559, 3,461,144, 3,493,563, 3,839,369, 4,031,080, and 4,277,409.

The C₃ functionality of the Δ^4 -3-keto (A), $\Delta^{1,4}$ -3-keto (B) and 3 β -hydroxy- Δ^5 - (C) steroid does not have to be protected for the processes of the present invention. The 3 β -hydroxy- Δ^5 - (C) steroid can have its C₃-hydroxyl group (Ca) protected as the silyl ether (Cb), ether (Cc) or ester (Cd), see Chart C. The free hydroxyl group (Ca) can be protected as the ether (Cc) or ester (Cd) as is well known to those skilled in the art. See Protective Groups in Organic Synthesis, Theodora W. Greene, Wiley & Sons, New York 1981. The ethers

(Cc) are prepared by methods well known to those skilled in the art, see Steroid Reactions, Edited by Carl Djerassi, Holden-Day, San Francisco 1967, p 76—82. If the free 3 β -hydroxy group (Ca) is not protected as the ether (Cc) or ester (Cd) during the silylation reaction, the free hydroxy group will be silylated to form the silyl ether (Cb). During the silylation reaction, if the 3 β -hydroxyl group is free and will be silylated, one additional equivalent of Grignard and silylating agent will be consumed. The C₃ protected forms of the 3 β -hydroxy steroids (C) are considered equivalent to the non-protected or free form (C) respectively since the C₃ protecting groups are readily removable to convert the C₃ protected forms (Cb, Cc and Cd) to (A and C). The protecting group remains on until the hydrolysis (acid or base) of the 17 α ,20-epoxide. If acid-hydrolysis is utilized and the C₃ protecting group is acid labile (Cb and Cc) it will be removed. Likewise if base hydrolysis is utilized and the C₃ protecting group is base-sensitive (Cd) it will be removed. If the C₃ protecting group is not sensitive to the hydrolysis agent, the C₃ protected steroid will have to be treated with the appropriate agent to remove the C₃ protecting group.

It is preferred that the 16-unsaturated corticoid (I A—C) be a Δ^4 -3-keto (A) or a $\Delta^{1,4}$ -3-keto (B) corticoid, more preferably a $\Delta^{1,4}$ -3-keto (B) corticoid. It is preferred that the 16-unsaturated corticoid have the C-ring $\Delta^{9(11)}$ or 9 β ,11 β -epoxy. It is more preferred that the C-ring be 9 β ,11 β -epoxy. It is preferred that R₆ be a hydrogen or fluorine atom, more preferred that R₆ be a hydrogen atom.

While it is preferred that the C-ring is $\Delta^{9(11)}$ or 9 β ,11 β -epoxy, the C-ring can be converted to the desired 9 α -fluoro-11 β -hydroxy functionality prior to the Grignard addition of the methyl group to the Δ^{16} double bond. If this is done, the 11 β -hydroxy group should be protected as is well known to those skilled in the art, see for example, US Patent 4,036,831 where the protecting group is trimethylsilyl. Following the formation of the desired 16 α -methyl corticoid, the (trimethylsilyl) protecting group is removed as is well known to those skilled in the art, see for example, US Patent 4,036,831.

The conjugate addition of a methylating agent, such as methyl Grignard, to a 16-unsaturated steroid to give the corresponding 16 α -methyl steroid is well known, see Organic Reactions in Steroid Chemistry, Vol. II, J. Fried and J. A. Edwards, p 75 and US Patent 3,072,686.

The 16-unsaturated corticoid (I) is reacted with a methylating agent followed by a silylating agent to give the enol silane $\Delta^{17(20)}$ -steroid (II). The methylating agent is selected from the group consisting of CH₃Cu, (CH₃)₂CuM or CH₃MgQ and a catalytic amount of a copper (cupric) salt. The preferred methylating agent is methyl Grignard, preferably methyl magnesium chloride. The copper salt can be a cuprous salt such as cuprous chloride, bromide, iodide or cyanide or a cupric salt such as cupric chloride, cupric acetate, cupric propionate or complexes thereof. Examples of copper complexes include, cuprous bromide dimethylsulfide, cuprous chloride tris-n-butylphosphine and cuprous acetylacetonate. The nature of the copper complex is not critical. Hundreds (or thousands) of copper complexes are known which are considered equivalent to those set forth above. Preferred is cupric acetate or propionate. Additional catalysts which are considered equivalent to those disclosed above are well known to those skilled in the art, see, for example, Alfa Catalog, 1983—1984, Morton Thiokol, Inc., Alpha Products, PO Box 299, 152 Andover Street, Danvers, Mass. 01923. Solvents suitable for the methylation reaction include those selected from the group consisting of THF, t-butylmethyl ether or dimethoxyethane. The reaction is performed in a range of from about -50° to about 20°, preferably at about -20°. When TLC indicates that no starting material is left (indicating the probable formation of an enolate intermediate), the silylating agent is added and the resulting product is the $\Delta^{17(20)}$ steroid (II). After the silylating agent is added the reaction temperature is kept in the range of about -25° to about 25°, preferably about 0°.

In the present invention the enolate intermediate is trapped with the silylating agent which gives the $\Delta^{17(20)}$ -20-(substituted silyl) product. Operable silylating agents include (R₂₀)₃-Si-E, bistrimethylsilylacetamide. It is preferred that the silylating agent be of the formula (R₂₀)₃-Si-E, more preferably trimethylsilyl chloride. Additional silylating agents considered equivalent to those disclosed above are well known to those skilled in the art, see, for example Silicon Compounds, Petrarch Systems, Inc., Barram Rd. Bristol, PA 19007. The trapping of the enolate intermediate to produce the $\Delta^{17(20)}$ -20-(acetate) is known, see US Patent 4,031,080 and Organic Reactions in Steroid Chemistry, Vol. II, supra, p 76. These enol acylates are too unreactive to react selectively over A, B, C-ring functionality such as $\Delta^{9(11)}$. However, surprisingly and unexpectedly the $\Delta^{17(20)}$ -20-(substituted silyl) derivative (II) is sufficiently reactive to react with electrophiles without affecting most of the other functionality in the A, B, C-rings.

The $\Delta^{17(20)}$ -steroid (II) can be isolated if desired by means well known to those skilled in the art, see for example, Example 1 and 8. However, since the desired product is the 16 α -methyl corticoid (V), it is not necessary and preferable not to isolate the $\Delta^{17(20)}$ -steroid (II) but rather to continue the reaction, see Examples 3—5, 11 and 12.

The $\Delta^{17(20)}$ -steroid (II) is reacted with a peracid to produce the 17 α ,20-epoxide (III). While most peracids are operable, preferred peracids include m-chloroperbenzoic, perbenzoic, peracetic. The peracid-reaction conditions are well known to those skilled in the art. The peracid reaction does not significantly affect the Δ^1 , Δ^4 , or $\Delta^{9(11)}$ functionalities in the remainder of the molecule, see Example 2. The solvent used during the methylation reaction producing the $\Delta^{17(20)}$ -steroid (II) is removed and replaced by a non-polar solvent such as toluene, methylene chloride, ethyl acetate or t-butyl methyl ether. The inorganic salts remaining after the methylation reaction are removed by extraction. The peracid oxidation is performed in the temperature range of about -10° to 25°. When the reaction is complete, the excess peracid is destroyed by addition of an agent such as powdered sodium thiosulfate or sodium bisulfite. The 17 α ,20-epoxide (III) can

be isolated if desired by means well known to those skilled in the art. However, since the desired product is the 16 α -methyl corticoid (V), it is not necessary and preferable not to isolate the 17 α ,20-epoxide (III) but rather to continue the reaction in situ.

The 17 α ,20-epoxide (III) is transformed to the corresponding 16 α -methyl corticoid (V) by acid or base hydrolysis. If base is used the 16 α -methyl corticoid will be obtained as the 21-hydroxy compound (R_{21} is a hydrogen atom). If acid is used the 16 α -methyl corticoid will be the 21-ester (R_{21} is $-\text{COR}-R_{21}'$). Suitable base hydrolyzing agents include hydroxide, carbonate, bicarbonate, alkoxide in alcohol at low temperature etc. It is preferred that the hydrolyzing agent be an acid. Suitable acids include mineral acids and other sufficiently strong acids such as p-TSA, sulfuric, hydrochloric, citric or acetic. The acid hydrolysis is sufficiently fast that the reaction is complete in about $\frac{1}{2}$ hour at 20–25°.

The α -methyl corticoids (V) are adrenocorticoid agents with glucocorticoid activity and are useful primarily for their anti-inflammatory effects as is well known to those skilled in the art. These include dexamethasone, flumethasone and paramethasone. One of the best known 16 α -methyl corticoids is dexamethasone, see US Patent 3,375,261 and Reissue 28,369 as well as the Physicians Desk Reference 1983, 37th edition, p 1270–1283.

If the C-ring of the 16 α -methyl corticoid (V) is $\Delta^{9(11)}$ or 9 β ,11 β -epoxy, it is readily convertible to the pharmacologically active 9 α -fluoro-11 β -hydroxy C-ring by means well known to those skilled in the art.

Definitions

The definitions and explanations below are for the terms as used throughout the entire patent application including both the specification and the claims.

All temperatures are in degrees Centigrade.

TLC refers to thin-layer chromatography.

THF refers to tetrahydrofuran.

TMS refers to trimethylsilyl.

THP refers to tetrahydropyranyl.

EEE refers to (1-ethoxy) ethyl ether [$-\text{O}-\text{CH}(\text{CH}_3)\text{OCH}_2\text{CH}_3$].

p-TSA refers to p-toluenesulfonic acid monohydrate.

When solvent pairs are used, the ratio of solvents used are volume/volume (v/v).

DMSO refers to dimethylsulfoxide.

UV refers to ultraviolet spectroscopy.

NMR refers to nuclear (proton) magnetic resonance spectroscopy, chemical shifts are reported in ppm (δ) downfield from tetramethylsilane.

$[\alpha]_D^{25}$ refers to the angle of rotation of plane polarized light (specific optical rotation) at 25° with the sodium D line (5893Å).

Dexamethasone refers to 9 α -fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione.

Paramethasone refers to 6 α -fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione.

Flumethasone refers to 6 α ,9 α -difluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione.

R_3 is alkyl of 1 thru 3 carbon atoms, a TMS, THP, or EEE group.

R_3' is alkyl of 1 thru 5 carbon atoms or phenyl.

R_6 is a hydrogen or fluorine atom or methyl group.

R_9 is nothing, a hydrogen, fluorine or oxygen atom which makes the C ring

a) $\Delta^{9(11)}$ when R_9 is nothing and

b) 9 β ,11 β -epoxide when R_9 and R_{11} taken together are an oxygen atom.

R_{11} is a hydrogen or oxygen atom, two hydrogen atoms, or α - or β -hydroxy group or trimethylsilyl ether thereof which makes the C-ring

a) $\Delta^{9(11)}$ when R_{11} is a hydrogen atom,

b) 9 β ,11 β -epoxide when R_9 and R_{11} taken together are an oxygen atom and between C_{11} and R_{11} is a single bond, and

c) a ketone when R_{11} is an oxygen atom and between C_{11} and R_{11} is a double bond.

R_{20} is alkyl of 1 thru 4 carbon atoms or phenyl, the R_{20} 's can be the same or different.

R_{21} is a hydrogen atom, $-\text{CO}-R_{21}'$ or $-\text{Si}(R_{121})_3$.

R_{21}' is alkyl of 1 thru 4 carbon atoms or phenyl.

R_{121} is alkyl of 1 thru 4 carbon atoms or phenyl, the R_{121} 's can be the same or different.

~ indicates that the attached group can be in either the α or β configuration.

 is a single or double bond.

When the term "alkyl of through carbon atoms" is used, it means and includes isomers thereof where such exist.

X is a hydrogen atom or nothing; when X is nothing the at C_3 is a double bond and when X is a hydrogen atom the at C_3 is a single bond.

M is a lithium or magnesium ion.

Q is a chlorine, bromine or iodine atom.

E is a chlorine, bromine or iodine atom or $-\text{NRaRb}$.

R_a is alkyl of 1 thru 5 carbon atoms or phenyl and may be connected or cyclized with R_B in a ring with or without an oxygen or additional nitrogen atom.

R_B is alkyl of 1 thru 5 carbon atoms or phenyl and may be connected or cyclized with R_a in a ring with or without an oxygen or additional nitrogen atom.

EXAMPLES

Without further elaboration, it is believed that one skilled in the art can, using the preceding description, practice the present invention to its fullest extent. The following detailed example describe how to prepare the various compounds and/or perform the various processes of the invention and are to be construed as merely illustrative, and not limitations of the preceding disclosure in any way whatsoever. Those skilled in the art will promptly recognize appropriate variations from the procedures both as to reactants and as to reaction conditions and techniques.

Example 1

20,21-Dihydroxy-16 α -methylpregna-1,4,9(11),17(20)-tetraen-3-one 20-trimethyl silyl ether 21-acetate (IIb)
Methyl magnesium chloride in THF (2 M, 4.5 ml) is added over a period of 2.5 hr to a mixture of 21-hydroxypregna-1,4,9(11),16-tetraene-3,20-dione 21-acetate (IB, US Patent 4,031,080, 2.0 g), THF (27 ml) and cupric acetate monohydrate (60 mg) previously cooled to -52°. The reaction temperature is kept at less than -40° during the Grignard addition. Following the Grignard addition, TLC indicated no starting material is left and the reaction temperature is quenched with trimethylsilyl chloride (1.1 ml). The reaction temperature is then slowly permitted to rise to 4° over a period of 3 hr at which time TLC indicated the reaction is complete. Toluene (15 ml) is added and the THF removed under reduced pressure maintaining the reaction medium at 10-15°. The reaction mixture is first extracted with a pH 7 buffer, then 4 times with buffer (1 ml) and water (9 ml) and lastly with water. The layers are separated and the organic layer is dried over sodium sulfate at less than 0° for 48 hr. The toluene solution is divided into 35 two-ml portions, one of which is concentrated under reduced pressure to give the title compound.

Example 2

17 α ,21-Dihydroxy-16 α -methylpregna-1,4,9(11)-triene-3,20-dione 21-acetate (V)
m-Chlorperbenzoic acid (0.556 g) is added dropwise to 20,21-dihydroxy-16 α -methylpregna-1,4,9(11),17(20)-tetraen-3-one 20-trimethylsilyl ether 21-acetate (IIb, Example 1, one 35 ml aliquot) over about a 3 hr period keeping the bath temperature in the range of about -9° to about 0°. The reaction is quenched with sodium bisulfite (1 M, 2.8 ml). Water is added and the phases are separated. The organic phase is washed with water, buffer and water, dried over sodium sulfate and concentrated to a solid. The solid is dissolved in ethyl acetate/hexane (5 ml) and crystals formed overnight. The filtrate is concentrated to a solid which is dissolved in methanol and cooled to 0°. The mixture is filtered, and the crystals washed with cold methanol.

TLC shows some 21-hydroxy compound (V) is present. Acetic anhydride (0.1 ml) and pyridine (0.4 ml) is added and the mixture stirred overnight. The mixture is worked up as is well known to those skilled in the art to give a solid which is crystallized from 40% aqueous methanol to give the title compound.

Example 3

9 β ,11 β -Epoxy-17 α ,21-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione 21-acetate (VB)

A mixture of 9 β ,11 β -epoxy-21-hydroxypregna-1,4,16-triene-3,20-dione 21-acetate (IB), Example 7, 3.824 g) and cupric acetate monohydrate (200 mg) and anhydrous THF (70 ml) at -15° is treated with methyl magnesium chloride (2.2 M, 8.2 ml) added dropwise over 1 hour. After 10 minutes of stirring at -15° trimethylchlorosilane (1.64 ml) is added. The mixture is immediately warmed to 20°, stirred for 1 hour at which time TLC shows enol ether (II) formation to be complete. The mixture is added to toluene (100 ml) and this is washed with monobasic phosphate buffer (pH 4.25, 50 ml). The organic layer is separated and washed with water (2 x 50 ml) and each aqueous layers is back-extracted with toluene (15 ml). The organic phases are combined and concentrated at 55° under reduced pressure to a residue.

Toluene (30 ml) at 0° is added and the mixture treated with peroxyacetic acid (34.5%, 2.91 ml) containing sodium acetate (164 mg). The stirred mixture is warmed to 20° and after 10 minutes TLC indicates the peroxidation is complete. The excess peracid is destroyed by addition of powdered sodium thiosulfate (2.5 g) slurried in methanol (10 ml). Hydrochloric acid (6 N, 3.0 ml) is added and the hydrolysis is complete in about 10 minutes. The mixture is added to toluene (75 ml) and the organic phase washed with water (2 x 50 ml), sodium carbonate solution (5%, 40 ml) and finally with water (50 ml). Each aqueous phase is back-extracted sequentially with toluene (20 ml). The organic phases are combined and concentrated under reduced pressure to a crystalline residue which is dissolved in hot ethyl acetate and filtered to remove traces of inorganics. Ethyl acetate (about 5 ml) is used for rinse. The combined volumes of the filtrate and rinse are reduced to about 10 ml. The solids formed and after about 1 hour hexane (40 ml) is added. After standing at 30-40° for 2 hours the slurry is cooled to 20°, and the solids collected by vacuum filtration. The solids are washed with cold ethyl acetate:hexane, 1:1 (3 ml), and dried under reduced pressure at 50-60° for 3 hours to give the title compound, mp 180-186° with softening at about 135°; NMR (CDCl₃) 0.89, 0.92, 1.43, 3.18 and 4.83 δ .

Example 4

9 β ,11 β -Epoxy-6 α -fluoro-17 α ,21-dihydroxy-16 α -methyl pregna-1,4-diene-3,20-dione (VB)

A mixture of 9 β ,11 β -epoxy-6 α -fluoro-21-hydroxy-1,4,16-triene-3,20-dione 21-acetate (IB, US Pat. 3,210,341, 8.009 g) cupric acetate monohydrate (400 mg) and tri-*n*-butyl phosphine (1 ml) in anhydrous THF (120 ml) at +11° is treated with methyl magnesium chloride (1.95 M, 26.5 ml) added dropwise over 1 hour. Trimethylchlorosilane (4 ml) at -8° is then added. The mixture is immediately allowed to warm to 14° and after 20 minutes TLC indicates the reaction is complete. The mixture is added to ethyl acetate (300 ml) and washed with ammonium hydroxide:saturated ammonium chloride, 1:1 (2 x 75 ml). Each aqueous extract is sequentially extracted with the same portion of ethyl acetate (210 ml). The combined organic phases are then concentrated at 45° under reduced pressure to an oil. The oil is taken up in methylene chloride (120 ml) at -10° and treated with *m*-chloroperoxybenzoic acid (85%, 6.092 g) and after 1.5 hours TLC indicates the epoxidation is complete. The mixture is vacuum distilled to replace the solvent with methanol (100 ml) and then the mixture is treated with saturated sodium carbonate (20 ml). After stirring 16 hours at 20-25° and 5.25 hours at 55° TLC showed the hydrolysis is complete. After cooling to 20-25° water (100 ml) is added and the pH adjusted to 7.5 using acetic acid (0.2 ml). Water (160 ml) is then added portion-wise at 5°. The solids that formed are collected by filtration, washed with 0° methanol in water (25:75, 50 ml) and dried under reduced pressure at about 84° over 16 hours to give the title compound, mp 241-241.5 [α]_D²⁵ = +45.7° (DMSO); Uv λ_{max} = 245 nm (ε = 15,300); NMR (CDCl₃/DMSO-d₆) 0.82, 0.82, 1.40, 3.30, 4.3 and 5.52 δ.

Example 5

17 α ,21-Dihydroxy-16 α -methylpregna-4,9(11)-diene-3,20-dione 21-acetate (VA)

Methyl magnesium chloride in THF (2 M, 6.2 ml) is added to a mixture of 21-hydroxypregna-4,9(11),16-triene-3,20-dione 21-acetate (IA, US Patent 4,216,159, 3.68 g) and cupric acetate monohydrate (200 mg) in dry THF (100 ml) at -50° over a period of 17 minutes. The mixture is stirred at -45 to -50° for 20 minutes and then treated with trimethylchlorosilane (1.9 ml) and allowed to warm to 20-25°. After 1.5 hours a 20-25° TLC indicates the enol silyl ether formation is complete. The reaction mixture is added to ethyl acetate (150 ml) and this mixture is washed with cold sulfuric acid (5%, 200 ml), the layers are separated the aqueous layer is back-extracted with ethyl acetate (25 ml). The original organic layer is washed with cold water (2 x 150 ml) which in turn was back-extracted with additional ethyl acetate. The organic layer phases are combined and concentrated under reduced pressure to about 100 ml.

m-Chloroperoxybenzoic acid (85%, 1.72 g) is added and the mixture stirred 1 hour at -15° following which another 300 mg of peracid is added and the mixture stirred at 20° overnight. The excess peracid is destroyed by treatment with sodium bisulfite solution (10%, 20 ml). The mixture is stirred for 20 minutes and then diluted with toluene (200 ml). The mixture is then washed with sulfuric acid (5%, 100 ml) and water (2 x 100 ml). After concentration to dryness under reduced pressure the residue is dissolved in methanol (100 ml) and treated again with hydrochloric acid (3 N, 0.5 ml). The mixture is again concentrated to a higher boiling residue which is taken up in toluene (200 ml). This mixture is washed with saturated sodium carbonate (100 ml) to remove the *m*-chlorobenzoic acid. Finally the organic layers are washed with water (2 x 100 ml) and concentrated as above. The residue dissolved in hot methanol (20 ml) for crystallization. After cooling to 0° for several hours a solid is obtained which is collected by vacuum filtration. The product is washed with cold methanol and dried at 20° to give the title compound; NMR 0.73, 0.93, 1.33 and 4.98 δ.

Example 6

9 β ,11 β -Epoxy-21-hydroxypregna-4,16-diene-3,20-dione 21-acetate (IA)

Following the general procedure of US Patent 3,876,633 and making non-critical variations, but starting with 21-hydroxypregna-4,9(11),16-triene-3,20-dione 21-acetate (US Patent 2,773,080), the title compound is obtained, mp 129-130.5°.

Example 7

9 β ,11 β -Epoxy-21-hydroxypregna-1,4,16-diene-3,20-dione 21-acetate (IB)

Following the general procedure of US Patent 3,876,633 and making non-critical variations, but starting with 21-hydroxypregna-1,4,9(11),16-tetraene-3,20-dione 21-acetate (US Patent 2,864,834) the title compound is obtained, mp 163.5-165°.

Example 8

9 β ,11 β -Epoxy-17 α ,21-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione (VB)

A mixture of 9 β ,11 β -epoxy-21-hydroxypregna-1,4,16-triene-3,20-dione 21-acetate (IB, Example 7, 7.650 g) and cupric acetate monohydrate (400 mg) in dry THF (130 ml) is stirred under nitrogen. The temperature is adjusted to -20° and 1,1,3,3-tetramethylurea (5.0 ml) is added. Methyl magnesium chloride (2M, 16.6 ml) is added dropwise over 50 min at -17 to -19°. TLC indicates the Grignard reaction is complete. The mixture is stirred for 40 min at -19°, following which the magnesium enolate is quenched with trimethylchlorosilane (3.28 ml). The temperature rises to 25° during the 1hr stir period. TLC shows this reaction is complete. The mixture is added to toluene (150 ml) and monobasic potassium phosphate buffer

(pH 4.3, 10%, 50 ml). The aqueous layer is extracted with toluene (25 ml) and then is discarded. The two organic layers are washed sequentially with water (2 x 50 ml), then combined and concentrated to a high boiling residue.

The residue containing the $\Delta^{17(20)}$ -20-enol silane is dissolved in toluene (60 ml). After cooling to -5 ± 5.9 ml of 4.4 M peroxyacetic acid containing sodium acetate (91 mg) is added and the mixture stirred for 80 min. TLC shows the epoxidation is complete. The excess peracid is destroyed with aqueous sodium bisulfite (1.5 M, 10 ml) at about 0° . After stirring 5 min the mixture is added to toluene (40 ml) and water (55 ml). The layers are separated and the aqueous phase is extracted with toluene (20 ml) and then discarded. The two organic layers are washed sequentially with saturated sodium bicarbonate (20 ml) and water (35 ml). The combined organic layers are filtered thru cotton and concentrated to a high boiling residue of the 17 α ,20-epoxide.

The epoxide is taken up in methanol (60 ml) and treated with p-TSA (5 mg) at 21° . After 6 min TLC indicates the epoxide is opened and the 16 α -methyl corticoid has formed (as the 21-acetate). A saturated sodium carbonate solution (1.9 ml) is added and the slurry stirred at 55° for 45 min. TLC indicates the hydrolysis is complete. Water (30 ml) is added and the slurry is stored at 0° overnight. The solids are collected by filtration, washed with methanol/water (1/1) and dried under reduced pressure at 70° for 4.5 hr to give the title compound, mp $238-239.5^\circ$.

Example 9

9 β ,11 β -Epoxy-20,21-dihydroxy-16 α -methylpregna-1,4,17(20)-trien-3-one-20-trimethylsilyl ether 21-acetate (IIB)

Following the general procedure of Example 1 and making non-critical variations but starting with 9 β ,11 β -epoxy-21-hydroxy-1,4,16-triene-3,20-dione 21-acetate (IB, Example 7) the title compound is obtained.

Example 10

9 α -Fluoro-11 β ,21-dihydroxypregna-1,4,16-triene-3,20-dione 21-acetate (IB)

9 β ,11 β -Epoxy-21-hydroxypregna-1,4,16-triene-3,20-dione 21-acetate (IB, Example 7, 15.3 g) is added to a stirred mixture of aqueous hydrogen fluoride (72%, 55 ml) and methylene chloride (15 ml) at -25° in a 200 ml monel reactor fitted with a mechanical agitator. About 30 ml of methylene chloride is used as a rinse. The mixture is stirred at -22° for 2.5 hr and then at -4° to -11° for 4.0 hr. The mixture is treated with THF (35 ml) at -10° and then quenched carefully by slow addition of a mixture of THF (60 ml), aqueous potassium carbonate (47%, 202 ml) and water (100 ml). After stirring 20 min the mixture is added to toluene (400 ml) and water (400 ml). The phases are separated and the organic layer is washed with water (3 x 150 ml), dried by filtration thru cotton and concentrated to about 150 ml. Methylene chloride (about 150 ml) and magnesol (0.90 g) is added to the mixture. After 15 min the magnesol is removed by filtration. The filtrate is again concentrated to 150 ml and then cooled to 0° . Solids form after stirring at 0° for 3 hr and the product is collected by filtration. The solids are washed with toluene (2 x 25 ml) and dried at 60° for 3 hr under vacuum to give the title compound, mp = $223-225^\circ$; NMR (CDCl₃) 1.27, 1.59, 4.29, 4.93 and 6.77 δ .

Example 11

9 α -Fluoro-11 β ,20,21-trihydroxy-16 α -methylpregna-1,4,17(20)-trien-3-one 11,20-bis(trimethylsilyl)ether 21-acetate (IIB)

A solution of copper (II) propionate (151 mg) in dry THF (60 ml) is cooled to -30° and then treated with methyl magnesium chloride (2 M, about 1 ml) in order to reduce the copper to copper (I). 9 α -Fluoro-11 β ,21-dihydroxypregna-1,4,16-triene-3,20-dione 21-acetate (IB, Example 10, 2.025 g) is added to the copper mixture. The temperature is adjusted to -33° and the above Grignard reagent (3.0 ml) is added. A slurry forms which is dissolved when treated with trimethylsilyl chloride (1.50 ml). After stirring 1 hr at -40° another 7.4 ml of the Grignard reagent is added portionwise over 50 min. The mixture is stirred another 2 hr and the temperature is allowed to rise to -26° . Then trimethylsilyl chloride (2.0 ml) is added over 1.25 hr at -15° . TLC indicates formation of the $\Delta^{17(20)}$ -enol ether is not complete after another 0.5 hr at -15° . Grignard reagent (3.0 ml) is added at -35° . After 20 min the mixture is added to toluene (150 ml). This mixture is washed with 150 ml of water containing 20 ml of 5% phosphate buffer (pH 6.5). The phases are separated and the organic layer is washed with water (2 x 75 ml) and then dried by filtration thru cotton to give the title compound in solution.

Example 12

17 α ,20-Epoxy-9 α -fluoro-11 β ,20,21-trihydroxy-16 α -methylpregna-1,4-dien-3-one 11,20-bis(trimethylsilyl)ether 21-acetate (IIIB)

The above filtrate (Example 11) is concentrated to about 50 ml and after cooling this mixture to -17° , peroxyacetic acid (4.44 M, 3.37 ml) containing sodium acetate (67 mg) is added. The mixture is stirred for 4 hr while the temperature is allowed to rise to 7° . The mixture is diluted with toluene and then washed with water (75 ml), dilute sodium sulfite and finally with water (75 ml). Each aqueous wash is back-extracted

with toluene (50 ml). The organic phases are combined, and concentrated under vacuum distillation to give a higher boiling residue of crude 17(20)-epoxide-20-trimethylsilyl ether (III).

Example 13

5 9 α -Fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione 21-acetate (VB)

The residue (Example 12) is dissolved in methanol (30 ml) and allowed to stand at room temperature. After 0.75 hr the mixture is concentrated to 15 ml and water (10 ml) is added. The mixture is filtered to remove traces of insoluble material. The filtrate is diluted with more water and a waxy solid is collected by decantation. The solid is dried and then recrystallized from acetone/hexane (1/2, 35 ml). The solids are
10 collected by filtration, washed with acetone/hexane (1/2, 5 ml) and dried at room temperature to give the title compound. A pure sample of the title compound is obtained by column chromatography followed by crystallization from acetone/hexane (1/1), mp = 27 - 229°; NMR (CDCl₃) 0.89, 1.03, 1.57, 4.29 and 4.93 δ .

Example 14

15 17 α ,20-Epoxy-20,21-dihydroxy-16 α -methylpregna-1,4,9(11)-trien-3-one 20-trimethylsilyl ether 21-acetate (IIIB)

Following the general procedure of Example 12 and making non-critical variations, but starting with 20,21-dihydroxy-16 α -methylpregna-1,4,9(11),17(20)-tetraen-3-one 20-trimethylsilyl ether 21-acetate (IIB, Example 1) the title compound is obtained.

20

Example 15

9 β ,11 β ,17 α ,20-Diepoxy-20,21-dihydroxy-16 α -methylpregna-1,4-dien-3-one 20 trimethylsilyl ether 21-acetate (IIIB)

Following the general procedure of Example 12 and making non-critical variations, but starting with
5 9 β ,11 β -epoxy-20,21-dihydroxy-16 α -methylpregna-1,4,17(20)-trien-3-one 20-trimethylsilyl ether (21-acetate (IIB, Example 9) the title compound is obtained

Claims

1. A $\Delta^{17(20)}$ -corticoid of the formula

(II A-C)

- or a C_3 -protected form of the 3β -hydroxy- Δ^5 - compound thereof, where
- R_6 is a hydrogen or fluorine atom or methyl group;
 - R_9 is nothing, a hydrogen, fluorine or oxygen atom which makes the C ring
 - a) $\Delta^{9(11)}$ when R_9 is nothing and
 - b) $9\beta,11\beta$ -epoxide when R_9 and R_{11} taken together are an oxygen atom;
 - R_{11} is a hydrogen or oxygen atom, two hydrogen atoms, or α - or β -hydroxyl group or trimethylsilyl ether thereof which makes the C-ring
 - a) $\Delta^{9(11)}$ when R_{11} is a hydrogen atom,
 - b) $9\beta,11\beta$ -epoxide when R_9 and R_{11} taken together are an oxygen atom and between C_{11} and R_{11} is a single bond, and
 - c) a ketone when R_{11} is an oxygen atom and between C_{11} and R_{11} is a double bond;
 - R_{20} is alkyl of 1 thru 4 carbon atoms or phenyl, the R_{20} 's can be the same or different;
 - R_{21} is a hydrogen atom, $-\text{CO}-R_{21}'$ or $-\text{Si}(R_{121})_3$;
 - R_{21}' is alkyl of 1 thru 4 carbon atoms or phenyl;
 - R_{121} is alkyl of 1 thru 4 carbon atoms or phenyl, the R_{121} 's can be the same or different;
- ~ indicates that the attached group can be in either the α or β configuration;
- is a single or double bond, and
- X is a hydrogen atom or nothing; when X is nothing the at C_3 is a double bond and when X is a hydrogen atom the at C_3 is a single bond.

2. A $\Delta^{17(20)}$ -corticoid according to Claim 1, which is a 3β -hydroxy- Δ^5 steroid in the free form

(Ca)

or C_3 protected form selected from the group consisting of

(Cb)

(Cc)

(Cd)

wherein R₃ is C₁-C₃ alkyl, trimethylsilyl, tetrahydropyranyl or 1-(ethoxy)ethoxy;

R₃' is C₁-₈ alkyl or phenyl; and

R₆, R₉, R₁₁, R₂₀ and are defined in claim 1.

3. A Δ¹⁷⁽²⁰⁾-corticoid according to claim 1, wherein R₉ is nothing or an oxygen atom and R₁₁ is a hydrogen atom or an oxygen atom, making the C-ring Δ⁹⁽¹¹⁾ or a 9β,11β-epoxide.

4. A 17α,20-epoxy steroid of the formula

(III A-C)

or a C₃-protected form of the 3β-hydroxy-Δ⁵ compound thereof, wherein R₆, R₉, R₁₁, R₂₀, R₂₁, , and X are as defined in claim 1.

5. A 17α,20-epoxy steroid according to claim 4, which is

17α,20-epoxy-20,21-dihydroxy-16α-methylpregna-1,4,9(11)-trien-3-one 20 trimethylsilyl ether 21-acetate;

9β,11β,17α,20-diepoxy-20,21-dihydroxy-16α-methylpregna-1,4-dien-3-one 20 trimethylsilyl ether 21-acetate; or

17α,20-epoxy-9α-fluoro-11β,20,21-trihydroxy-16α-methylpregna-1,4-dien-3-one 11,20-bis(trimethylsilyl) ether 21-acetate.

6. A 17 α -silyl ether of the formula

(IV A-C)

or a C₃ protected form of the 3 α -hydroxy- Δ^5 compound thereof, wherein R₆, R₉, R₁₁, R₂₀, R₂₁, ~, ~, ~ and X are as defined in claim 1.

7. A process for the preparation of a $\Delta^{17(20)}$ -steroid of the formula

(II)

which comprises (1) contacting a 16-unsaturated corticoid of the formula

(I)

with a methylating agent in the presence of a copper catalyst; and (2) contacting the product of step (1) with a silylating agent; wherein R₂₀ and R₂₁ are as defined in claim 1.

8. A process according to claim 7, wherein the methylating agent is selected from CH₃Cu, (CH₃)CuM and CH₃MgQ where M is a lithium or magnesium ion and Q is a chlorine, bromine or iodine atom.

9. A process for the preparation of a 17 α ,20-epoxide of the formula

(III)

wherein R₂₀ and R₂₁ are as defined in claim 1, which comprises contacting a $\Delta^{17(20)}$ -steroid of formula (II) as defined in claim 7, with a peracid.

Patentansprüche

1. Ein $\Delta^{17(20)}$ -Corticoid der Formel

(II A-C)

oder eine C₃-geschützte Form der 3 β -Hydroxy- Δ^8 -Komponente davon, in welcher,

R₆ ein Wasserstoff- oder Fluoratom oder Methylgruppe ist;

R₉ nichts, ein Wasserstoff-, Fluor- oder Sauerstoffatom, ist, welches den folgenden C Ring darstellt

a) $\Delta^{9(11)}$, wenn R₆ nichts ist und

b) 9 β , 11 β -Epoxid, wenn R₆ und R₁₁ zusammen genommen ein Sauerstoffatom sind;

R₁₁ ein Wasserstoff- oder Sauerstoffatom, zwei Wasserstoffatome, oder α - oder β -Hydroxylgruppe oder Trimethylsilyläther davon ist, welches den folgenden C-Ring darstellt

a) $\Delta^{9(11)}$, wenn R₁₁ ein Wasserstoffatom ist,

b) 9 β , 11 β -Epoxid, wenn R₆ und R₁₁ zusammen genommen ein Sauerstoffatom sind und zwischen C₁₁ und R₁₁ eine Einfachbindung ist, und

c) ein Keton, wenn R₁₁ ein Sauerstoffatom ist und zwischen C₁₁ und R₁₁ eine Doppelbindung ist;

R₂₀ Alkyl von 1 bis 4 Kohlenstoffatomen oder Phenyl ist, die R₂₀ können gleich oder verschieden sein;

R₂₁ ein Wasserstoffatom, $-\text{CO}-\text{R}_{21}'$ oder $-\text{Si}(\text{R}_{121})_3$ ist;

R_{21}'} Alkyl von 1 bis 4 Kohlenstoffatomen oder Phenyl ist;

R₁₂₁ Alkyl von 1 bis 4 Kohlenstoffatomen oder Phenyl ist, die R₁₂₁ können gleich oder verschieden sein;

 zeigt an, dass die angegliederte Gruppe entweder in der α oder β Konfiguration sein kann;

 eine Einfach- oder Doppelbindung ist; und

X ein Wasserstoffatom oder nichts ist; wenn X nichts ist, ist die bei C₃ eine Doppelbindung, und wenn X ein Wasserstoffatom ist, ist die bei C₃ eine Einfachbindung.

2. Ein $\Delta^{17(20)}$ -Corticoid nach Anspruch 1, welches ein 3 β -Hydroxy- Δ^8 -Steroid in der freien Form

(Ca)

ist, oder der C₃ geschützten Form, ausgewählt von der Gruppe bestehend aus

(Cb)

(Cc)

worin R_3 C_{1-5} Alkyl, Trimethylsilyl, Tetrahydropyranyl oder 1-(Äthoxy)äthoxy ist;

R_3' C_{1-5} Alkyl oder Phenyl ist; und

R_6 , R_9 , R_{11} , R_{20} und $\sim$ in Anspruch 1 definiert sind.

3. Ein $\Delta^{17(20)}$ -Corticoid nach Anspruch 1, worin R_9 nichts oder ein Sauerstoffatom ist und R_{11} ein Wasserstoffatom oder ein Sauerstoffatom ist, das den C-Ring $\Delta^{(11)}$ oder ein 9 β ,11 β -Epoxid darstellt.

4. Ein 17 α ,20-Epoxysteroid der Formel

oder eine C_3 -geschützte Form der 3 β -Hydroxy- Δ^5 Verbindung davon, worin R_6 , R_9 , R_{11} , R_{20} , R_{21} , $\sim$, $\sim$ und X wie in Anspruch 1 definiert sind.

5. Ein 17 α ,20-Epoxysteroid nach Anspruch 4, welches 17 α ,20-Epoxy-20,21-dihydroxy-16 α -methylpregna-1,4,9(11)-trien-3-on 20-Trimethylsilyläther 21-Acetat; 9 β ,11 β ,17 α , 20-Diepoxysteroid-20,21-dihydroxy-16 α -methyl-pregna-1,4-dien-3-on 11,20- Bis(trimethylsilyl)äther 21-Acetat; oder

17 α ,20-Epoxy-9 α -fluor-11 β ,20,21-trihydroxy-16 α -methylpregna-1,4-dien-3-on 11,20-Bis(trimethylsilyl)äther 21-Acetat ist.

6. Ein 17 α -Silyläther der Formel

oder eine C_3 -geschützte Form der 3 α -Hydroxy- Δ^5 Verbindung davon, worin R_6 , R_9 , R_{11} , R_{20} , R_{21} , $\sim$, $\sim$ und X wie in Anspruch 1 definiert sind.

7. Ein Verfahren zur Herstellung eines $\Delta^{17(20)}$ -Steroids der Formel

welches umfasst (1) Kontaktieren eines 16-ungesättigten Corticoids der Formel

25 mit einem methylierenden Reaktionsmittel in der Gegenwart eines Kupferkatalysators; und (2) Kontaktieren des Produktes von Schritt (1) mit einem silylierenden Reaktionsmittel; worin R_{20} und R_{21} wie in Anspruch 1 definiert sind.

8. Ein Verfahren nach Anspruch 7, worin das methylierende Reaktionsmittel von CH_3Cu , $(\text{CH}_3)_2\text{CuM}$ und CH_3MgQ gewählt wird, wobei M ein Lithium- oder Magnesiumion und Q ein Chlor-, Brom- oder Jodatome ist.

9. Ein Verfahren zur Herstellung eines 17 α ,20-Epoxids der Formel

45 worin R_{20} und R_{21} wie in Anspruch 1 definiert sind, welches Kontaktieren eines $\Delta^{17(20)}$ -Steroids der Formel (II), wie definiert in Anspruch 7, mit einem Peroxid umfasst.

Revendications

1. $\Delta^{17(20)}$ -corticoïde de formule

ou une forme protégée au niveau de l'atome C₃ du dérivé à fonctionnalité 3 β -hydroxy- Δ^5 de ce composé, formule dans laquelle

R₆ représente un atome d'hydrogène ou de fluor ou un groupe méthyle;

R₉ ne représente rien ou représente un atome d'hydrogène, de fluor ou d'oxygène, ce qui confère au noyau C

a) une fonctionnalité $\Delta^{9(11)}$ lorsque R₉ ne représente rien, et

b) une fonctionnalité 9 β ,11 β -époxyde lorsque R₉ et R₁₁, pris conjointement, représentent un atome d'oxygène;

R₁₁ représente un atome d'hydrogène ou d'oxygène, deux atomes d'hydrogène ou un groupe α - ou β -hydroxy, ou bien un éther de triméthylsilyle de ce groupe, ce qui confère au noyau C

a) une fonctionnalité $\Delta^{9(11)}$ lorsque R₁₁ représente un atome d'hydrogène,

b) une fonctionnalité 9 β ,11 β -époxyde lorsque R₉ et R₁₁, pris conjointement, représentent un atome d'oxygène et la liaison entre C₁₁ et R₁₁ est une liaison simple, et

c) une cétone lorsque R₁₁ représente un atome d'oxygène et la liaison entre C₁₁ et R₁₁ représente une double liaison;

R₂₀ représente un groupe alkyle ayant 1 à 4 atomes de carbone ou un groupe phényle, les groupes R₂₀ pouvant être identiques ou différents;

R₂₁ représente un atome d'hydrogène, un groupe —CO—R₂₁' ou —Si(R₂₁)₃;

R₂₁' représente un groupe alkyle ayant 1 à 4 atomes de carbone ou un groupe phényle;

R₁₂₁ représente un groupe alkyle ayant 1 à 4 atomes de carbone ou un groupe phényle, les groupes R₁₂₁ pouvant être identiques ou différents;

le signe ~ indique que le groupe fixé peut présenter la configuration α ou β ;

la liaison est une liaison simple ou une double liaison; et

X représente un atome d'hydrogène ou ne représente rien; lorsque X ne représente rien, la liaison au niveau de l'atome C₃ est une double liaison et, lorsque X représente un atome d'hydrogène, la liaison au niveau de l'atome C₃ est une liaison simple.

2. $\Delta^{17(20)}$ -corticoïde suivant la revendication 1, qui est un 3 β -hydroxy- Δ^5 -stéroïde sous forme libre, de formule

(Ca)

ou sous une forme protégée au niveau de l'atome C₃, choisie dans le groupe comprenant les composés de formules

(Cb)

(Cc)

(Cd)

dans lesquelles R_3 représente un groupe alkyle en C_1 à C_3 , triméthylsilyle, tétrahydropyranylie ou 1-(éthoxy)éthoxy;

R_3' représente un groupe alkyle en C_1 à C_5 ou phényle; et

R_6 , R_9 , R_{11} , R_{20} et la liaison $\sim$ sont définis dans la revendication 1.

3. $\Delta^{17(20)}$ -corticoïde suivant la revendication 1, dans lequel R_9 ne représente rien ou représente un atome d'oxygène et R_{11} représente un atome d'hydrogène ou un atome d'oxygène, ce qui confère au noyau C une fonctionnalité $\Delta^{9(11)}$ ou $9\beta,11\beta$ -époxyde.

4. $17\alpha,20$ -époxy-stéroïde de formule

(III A-C)

ou une forme protégée au niveau de l'atome C_3 du dérivé à fonctionnalité 3β -hydroxy- Δ^5 de ce composé, formule dans laquelle R_6 , R_9 , R_{11} , R_{20} , R_{21} , le signe $\sim$, la liaison $\sim$ et X répondent aux définitions suivant la revendication 1.

5. $17\alpha,20$ -époxy-stéroïde suivant la revendication 4, qui est

le 21-acétate d'éther 20-triméthylsilylique de $17\alpha,20$ -époxy-20,21-dihydroxy-16 α -méthylprégna-1,4,9(11)-triène-3-one;

le 21-acétate d'éther 20-triméthylsilylique de $9\beta,11\beta,17\alpha,20$ -diépoxy-20,21-dihydroxy-16 α -méthylprégna-1,4-diène-3-one; ou

le 21-acétate d'éther 11,20-bis(triméthylsilylique) de $17\alpha,20$ -époxy-9 α -fluoro-11 $\beta,20,21$ -trihydroxy-16 α -méthylprégna-1,4-diène-3-one.

6. Ether 17α -silylique de formule

(IV A-C)

ou une forme protégée au niveau de l'atome C_3 du dérivé à fonctionnalité 3α -hydroxy- Δ^5 de ce composé, formule dans laquelle R_6 , R_9 , R_{11} , R_{20} , R_{21} , le signe $\sim$, la liaison $\sim$ et X répondent aux définitions suivant la revendication 1.

7. Procédé de préparation d'un $\Delta^{17(20)}$ -stéroïde de formule

(II)

qui consiste (1) à mettre en contact un corticoïde insaturé en position 16, de formule

(I)

avec un agent de méthylation en présence d'un catalyseur au cuivre; et (2) à mettre en contact le produit de l'étape (1) avec un agent de silylation; formules dans lesquelles R_{20} et R_{21} répondent aux définitions suivant la revendication 1.

8. Procédé suivant la revendication 7, dans lequel l'agent de méthylation est choisi entre CH_3Cu , $(CH_3)_3CuM$ et CH_3MgQ dans lesquels M représente un ion lithium ou magnésium et Q représente un atome de chlore, de brome ou d'iode.

9. Procédé de préparation d'un 17 α ,20-époxyde de formule

(III)

dans laquelle R_{20} et R_{21} répondent aux définitions suivant la revendication 1, qui consiste à mettre en contact un $\Delta^{17(20)}$ -stéroïde de formule (II) répondant à la définition suivant la revendication 7, avec un peracide.
