SYSTEM AND METHODS FOR PROVISIONING A SERVICE FOR A COMMUNICATION DEVICE

Abstract

A system for provisioning an associated service for a device is described. The associated service allows a user to access a primary service and, optionally, one or more additional services through a mobile handheld device. The associated service is provisioned entirely through the handheld device. A system for provisioning the associated service receives provisioning requests from the device and creates and configures the associated service and, if needed, the primary service. The primary and additional services may be e-mail services, calendar services, contact management services or other data services. The associated service may be used simultaneously with different types of primary and additional services.
