

ABSTRACT**A COMBINATION OF SLIDE SWING DOOR**

5

The present invention discloses a door (100) comprises a first panel (110); a second panel (120); a plurality of hollow channel members (140) arranged with the first panel (110) and the second panel (120); and, a support structure (130) to which the first panel (110) is hinged. The door (100) further comprises a slide member (150)
10 arranged with the hollow channel members (140) of the first panel (110) and the second panel (120) to connect the second panel (120) with the first panel (110) and allow the second panel (120) to slide with respect to the first panel (110) simultaneously, allow the first panel (110) to swing from one position to another position while opening and closing of the door (100).
