ARTICLE TRANSPORT FACILITY

ABSTRACT OF THE DISCLOSURE

A normal control mode and a substitute control mode are set, as control modes that are executed by a control system including a higher-level control device Ct and a section control device Cz. The normal control mode is a mode in which control of a transport vehicle V in a specific section Z is performed by the section control device Cz responsible for the specific section Z, and the substitute control mode is a mode in which control of the transport vehicle V in a specific section Z is performed by the higher-level control device Ct instead of the section control device Cz responsible for the specific section Z. The substitute control mode is executed in response to at least one of an anomaly occurring in communication between the section control device Cz and the higher-level control device Ct and an anomaly occurring in communication between the section control device Cz and the transport vehicle V.
