

ABSTRACT

An alkaline detergent composition for hard surface comprises an alkaline agent (component A), a nonionic surfactant (component B), a chelating agent (component C), water (component D), at least one carboxylic acid compound
5 (component E) selected from the group consisting of compounds represented by general formula (1) and general formula (2), and at least one anionic surfactant (component F) selected from the group consisting of surfactants represented by general formula (3) and salts thereof. Therein, the content ratio [component E (weight %) / component B (weight %)] is 1/1.5 – 15/1, the content ratio [component F
10 (weight %) / component B (weight %)] is 10/1 – 1/5, and the pH at 25°C is 12 or greater.
