MONITOR PUTTY

ABSTRACT OF THE DISCLOSURE

Apparatus (10) for providing manipulative physical therapy includes a first mass (14) of a putty including a reaction product of siloxane with a boron- or tin-containing compound and a normal polysiloxane. At least one additional mass (18-32) of the putty is provided to the patient, the additional mass adaptable to be manually combined by the patient with the first mass (14) until a uniform color is achieved in the combined mass (38). Preferably, a plurality of additional masses (18-32) having a variety of colors are provided for successive combination with the combined mass. The apparatus provides a means by which the progress of manipulative physical therapy may be monitored, as a uniform color in the combined mass will be achieved only after extensive manipulation.
