

MASSAGER

ABSTRACT

A massager applies adequate pressing force to treatment area. The massager (1) includes a main body (3) to face a predetermined treatment area of a user, and a massage mechanism (4), provided inside a treating surface (S) of the main body (3) which faces the treatment area, to perform pressing massage on the treatment area. The massage mechanism (4) includes a first treating element (51) to massage the treatment area, and a position-changing mechanism (26) to change treatment-element position of the first treating element (51) in a vertical direction. The position-changing mechanism (26) is configured to change the treatment-element position between a first state where the first treating element is in a lowered position and a second state where the first treating element is in a raised position.
