(54) Title: REUSEABLE LINED CONTAINER AND CLOSURE SYSTEM THEREFOR

Fig. 3

(57) Abstract: A closure system (100) for a container comprises, as-
sembled or as a kit of parts: a cover (110) securable across an opening
in a container body so that the container body and cover together en-
close an interior space for the reception of contents of the container; a
liner (114) positionable adjacent to at least the cover for separating the
container contents from the cover when the cover is installed across
the opening; a flange (112) receivable in an aperture (138) through
the cover to define a passage (118) through the cover for filling and/
or discharging the container contents, the filling and discharge pas-
sage being closeable by a removable closure member (120), wherein
the liner is sealingly securable to the flange circumferentially of the
passage; and an adaptor (122) having an exterior screw thread (124)
engageable with an interior screw thread (126) provided in the flange
to secure the flange in the aperture. The adaptor (122) may therefore
be unscrewed from the flange (126), allowing the liner and flange to
be readily separated from the cover, without destroying any of the
liner, flange, adaptor, or cover. The adaptor (122) is concealed within
the closure assembly and protected by any anti-tamper features on the
closure member and/or associated components, such as an overcap
(136).
