

Summary

For the reduction of trigger-pull, where the hammer apparatus for hand held firearms is concerned, a restraining apparatus (103, 107) with a restraining spring (105) has been proposed which acts upon the hammer (13), if, and as long as, the said hammer (13) is in its cocked position. The force of the restraining spring (105) is, however, upon the release of said hammer (13) not great enough to hold this back. The force with which the restraining apparatus (103, 107) acts against the hammer (13), however diminishes the trigger force without impairing the striking force of the hammer (13).
