

Abstract

SHIP

This ship comprises a hull, a tank, a lower support section, and an elastic support section. The tank is installed on the hull and is filled with liquefied gas. In the cross-sectional shape of the tank orthogonal to the fore-and-aft direction, the upward-downward direction is set as the longitudinal direction, and the lower support section supports the tank from below on the hull. The elastic support section elastically supports the tank higher than the lower support section on the hull.
