Abstract

Title of Invention: DESIGN INFORMATION PROVISION DEVICE

[Abstract]

Provided is a design information providing device configured to allow a user to rationalize designing of a composite component with desired specifications and to convey useful technical knowledge on designing of the composite component to the user.

A design information providing server (1) includes a first webpage transmitter (8) configured to transmit data on a webpage displaying a plurality of composite components to a terminal (3), a second webpage transmitter (10) configured to transmit data on information such as a design consideration of a selected composite component at the terminal (3), and a file transmitter (12) configured to transmit, in response to a file request from the terminal (3), file data to the terminal (3), the file data containing information on the selected composite component with default specifications and elemental components thereof and information on elemental components of a selected composite component with non-default specifications.
