

METHOD AND APPARATUS FOR USER STATUS REMINDERS IN VIDEO COMMUNICATION

ABSTRACT

The present disclosure provides a method and apparatus for user status reminders in video communication, wherein the method may include: during a video communication procedure between a current user and another user, detecting, by monitoring, an intervening communication event; and sending a reminder message regarding the intervening communication event to the other user, the reminder message being operative to instruct as to whether the current user has a need to respond to the intervening communication event. Through technical solutions of the present disclosure, users participating in video communication may comprehend mutual status change conditions at any time, facilitating performing timely adjustments to the procedure and content of the video communication.
