

Abstract

The invention concerns a method for reconfiguring a musical instrument (1), comprising a step of applying a sticker (3) on at least one technical surface (2) of the musical instrument (1),

characterized in that this application is made without glue and in that the sticker (3) comprises an elastomer layer configured to come into contact with the technical surface (2) and adhere to it in a reversible manner without application of glue.

The invention further concerns a sticker (3) and an associated manufacturing method.
