

## ABSTRACT

Provided are a session response method and apparatus, an electronic device and a storage medium. The method comprises: acquiring multi-modal session information arranged according to a session time sequence, wherein the multi-modal session information includes first modal information and second modal information (S110); performing multi-modal semantic representation on at least two modal features in the first modal information to obtain a first representation vector (S120); performing semantic representation of a corresponding modality on the second modal information to obtain a second representation vector (S130); inputting the first representation vector, the second representation vector and the corresponding session time sequence into a session matching model, respectively, to obtain a matching result (S140); and responding to the multi-modal session information according to the matching result (S150).
