Claims

[Claim 1]

A ship comprising:

a hull having a pair of broadsides and a deck;

a tank provided on the hull so as to straddle a first space above the deck and a second space below the deck, supported on a lower deck provided below the deck, and capable of storing liquefied carbon dioxide; and

a loading pipe that is provided on a lower side with respect to an upper end of the tank and loads liquefied carbon dioxide, which is supplied from an outside of the ship, into the tank,

wherein the loading pipe includes

a first portion extending to follow the deck above the deck and having a connection part for connection with the outside of the ship, and

a second portion provided to be continuous with the first portion, extending downward from the first portion, extending from the first space to the second space, extending to follow the lower deck above the lower deck in a lower side with respect to a lower end of the tank, and connected to the lower end of the tank from below.

[Claim 2]

The ship according to claim 1, wherein a pipe end of the second portion that is connected to the lower end of the tank is provided at the same height as an inner peripheral surface of the lower end of the tank in an up-down direction.
