

ABSTRACT

The present disclosure provides a multimedia resource clipping method and apparatus, a device and a storage medium. The method comprises: first, playing a first video which is bound to an initial clipping draft, wherein the first video is used for displaying a production process of the initial clipping draft, and the initial clipping draft is used for indicating initial clipping operations for native multimedia material; and then, in response to a clipping trigger operation for the first video, displaying a multimedia resource clipping operation page according to a target clipping draft, wherein the target clipping draft is obtained on the basis of the initial clipping draft, the target clipping draft is used for indicating a target clipping operation for target material, the target material corresponds to all or some of the native multimedia material, and the target clipping operation comprises all or some of the initial clipping operations. By means of the present disclosure, the clipping of multimedia resources is implemented on the basis of an initial clipping draft which is bound to a first video, such that a clipping threshold of the multimedia resources is reduced, and the experience of a user participating in multimedia resource clipping is finally improved.
