

Abstract**SYSTEMS AND DEVICES FOR MANAGING IDENTIFICATION, VERIFICATION, AND
VALIDATION OF A PLURALITY OF COMPUTING DEVICES**

Embodiments relate to systems for managing computing device identification. The system is configured to establish communication between a processor and computing device. The system is configured to select a group of applications installed on the computing device. The system is configured to generate a ranked group of applications. The system is configured to select first and second metadata types. The system is configured to obtain first and second metadata of each application in the ranked group of applications. The first metadata of each application includes metadata corresponding to the first metadata type. The second metadata of each application includes metadata corresponding to the second metadata type. The system is configured to generate a payload. The payload includes the first and second metadata of each application. The system is configured to generate a unique device identifier for the computing device on the payload.
