(54) Title: STRUCTURE FOR ANTENNAE

FIG. 6

(57) Abstract: A radar system with a radome is protected from lightning strikes by a conductive projection projecting into space outside the radome in the manner of a lightning rod, and passing through the wall of the radome to the inside, where its proximal part is in electrical contact with, or in so close proximity as to constitute a spark gap with an internal conductive member which passes within the radome to provide a conductive path for example via a platform on which an antenna may be mounted, to ground, so as to provide a viable path from the conductive projection to ground.
