

BOTTLE OPENER CORK REMOVER

ABSTRACT OF THE DISCLOSURE

A device for removing a cork from a bottle, the device including: (a) a hollow needle, adapted to be inserted in the cork; and (b) pressurized gas sealed in an inner volume of a container; wherein the pressurized gas is adapted to be released from the container when a path of fluid communication is formed between a proximal end of the hollow needle and the inner volume of the container, such that the pressurized gas is channeled through the hollow needle, and into the cork or into the bottle, below the cork thereby forcing the cork out of the bottle.
