

## ABSTRACT

The application discloses a user code running method for a programming platform, a platform, a node, a device and a medium. The programming platform includes a service node, a task queue, and a computing node. The method includes: a service node acquires a user code for representing a user terminal, and places the user code in a task queue as a running task; a computing node monitors a task queue to acquire a running task; a computing node computes the running task to obtain a computation result; and the service node acquires the computation result from the computing node, and feeds back the computation result to the user terminal.
