

ABSTRACT

HANDOVER PROCESSING METHOD AND APPARATUS, AND COMMUNICATION DEVICE

Disclosed in the embodiments of the present application are a switching processing method and apparatus, and a communication device. The method comprises: when determining that a pre-defined condition is met, a user equipment transmitting, to an edge dispatch node, a domain name system (DNS) resolution request carrying first information, wherein the first information comprises user identifier information, application identifier information, and service continuity demand information; and receiving a DNS resolution response from the edge dispatch node, wherein the DNS resolution response comprises the updated address information of a second edge application server.
