**ABSTRACT**

The present invention relates to an animal carrying device. The animal carrying device comprises: a body which has a first wall and a second wall, the second wall being provided with a second opening; and a blocking member which is provided with a protective structure. The blocking member is movably connected to the body, such that the blocking member can be switched between a first position and a second position; when the blocking member is located at the first position, the protective structure at least partially covers the first wall; and when the blocking member is located at the second position, the blocking member at least partially blocks the second opening of the second wall.
