ABSTRACT

Disclosed in the embodiments of the present application are an audio copy detection method and apparatus, and a device, a storage medium and a program product. The method comprises: extracting a global audio feature corresponding to audio to be processed, and extracting an audio segment feature sequence corresponding to the audio to be processed; retrieving from an audio retrieval library an approximate global audio feature corresponding to the global audio feature; acquiring an audio segment feature sequence corresponding to target audio to which the approximate global audio feature belongs, and on the basis of the audio segment feature sequences respectively corresponding to the audio to be processed and the target audio, determining an audio similarity between the audio to be processed and the target audio; and if the audio similarity reaches a preset similarity or greater, determining the target audio as copy audio corresponding to the audio to be processed.
