

HETEROARYL INHIBITORS OF PDE4

[001] This application claims the benefit of United States Provisional Applications No. 61/718,285, filed October 25, 2012, No. 61/733,675, filed December 5, 2012, and No. 61/776,937, filed March 12, 2013, the disclosures of which are hereby incorporated by reference as if written herein in their entireties.

[002] Disclosed herein are new bicyclic heteroaryl compounds and compositions and their application as pharmaceuticals for the treatment of disease. Methods of inhibition of phosphodiesterase 4 (PDE4) activity in a human or animal subject are also provided for the treatment diseases such as inflammatory diseases and other diseases involving elevated levels of cytokines and proinflammatory mediators.

[003] Chronic inflammation is a multi-factorial disease complication characterized by activation of multiple types of inflammatory cells, for example cells of lymphoid lineage (including T lymphocytes) and myeloid lineage (including granulocytes, macrophages, and monocytes). Proinflammatory mediators, including cytokines, such as tumor necrosis factor (TNF) and interleukin-1 (IL-1), are produced by these activated cells. Accordingly, an agent that suppresses the activation of these cells, or their production of proinflammatory cytokines, would be useful in the therapeutic treatment of inflammatory diseases and other diseases involving elevated levels of cytokines.

[004] Cyclic adenosine monophosphate (cAMP) is a second messenger that mediates the biologic responses of cells to a wide range of extracellular stimuli. When the appropriate agonist binds to specific cell surface receptors, adenylate cyclase is activated to convert adenosine triphosphate (ATP) to cAMP. It is theorized that the agonist induced actions of cAMP within the cell are mediated predominately by the action of cAMP-dependent protein kinases. The intracellular actions of cAMP are terminated by either a transport of the nucleotide to the outside of the cell, or by enzymatic cleavage by cyclic nucleotide phosphodiesterases (PDEs), which hydrolyze the 3'-phosphodiester bond to form 5'-adenosine monophosphate (5'-AMP). 5'-AMP is an inactive metabolite.

[005] The superfamily of PDEs is subdivided into two major classes, class I and class II, which have no recognizable sequence similarity. Class I includes all known mammalian PDEs and is comprised of 11 identified families that are products of separate genes. Some PDEs are highly specific for hydrolysis of cAMP (PDE4, PDE7, PDE8), some are highly cGMP-specific (PDE5, PDE6, PDE9), and some have mixed specificity (PDE1, PDE2,

PDE3, PDE10, PDE11). All of the characterized mammalian PDEs are dimeric, but the importance of the dimeric structure for function in each of the PDEs is unknown.

[006] The PDE4 subfamily is comprised of 4 members: PDE4A, PDE4B, PDE4C, and PDE4D. These enzymes possess N-terminal regulatory domains that presumably mediate dimerization, which results in optimally regulated PDE activity. In addition, activity is regulated via cAMP-dependent protein kinase phosphorylation sites in this upstream regulatory domain. PDE4 enzymes are broadly expressed and distributed.

[007] Elevated levels of cAMP in human myeloid and lymphoid lineage cells are associated with the suppression of cell activation. The intracellular enzyme family of PDEs, therefore, regulates the level of cAMP in cells. PDE4 is a predominant PDE isotype in these cells, and is a major contributor to cAMP degradation. Accordingly, the inhibition of PDE function would prevent the conversion of cAMP to the inactive metabolite 5'-AMP and, consequently, maintain higher cAMP levels, and, accordingly, suppress cell activation.

[008] PDE4 inhibitors have been shown to inhibit production of TNF α and partially inhibit IL-1 β release by monocytes (see Semmler et al., *Int. J. Immunopharmacol.*, 15, pp. 409-413, (1993); Molnar-Kimber et al., *Mediators of Inflammation*, 1, pp. 411-417, (1992)). PDE4 inhibitors also have been shown to inhibit the production of superoxide radicals from human polymorphonuclear leukocytes (see Verghese et al., *J. Mol. Cell. Cardiol.*, 21 (Suppl. 2), S61 (1989); Nielson et al., *J. Allergy Immunol.*, 86, pp. 801-808, (1990)); to inhibit the release of vasoactive amines and prostanoids from human basophils (see Peachell et al., *J. Immunol.*, 148, pp. 2503-2510, (1992)); to inhibit respiratory bursts in eosinophils (see Dent et al., *J. Pharmacol.*, 103, pp. 1339-1346, (1991)); and to inhibit the activation of human T-lymphocytes (see Robicsek et al., *Biochem. Pharmacol.*, 42, pp. 869-877, (1991)).

[009] Inflammatory cell activation and excessive or unregulated cytokine (e.g., TNF α and IL-1 β) production are implicated in allergic, autoimmune, and inflammatory diseases and disorders, discussed herein.

[010] Additionally, several properties of TNF α , such as stimulation of collagenases, stimulation of angiogenesis in vivo, stimulation of bone resorption, and an ability to increase the adherence of tumor cells to endothelium, are consistent with a role for TNF in the development and metastatic spread of cancer in the host. TNF α recently has been directly implicated in the promotion of growth and metastasis of tumor cells (see Orosz et al., *J. Exp. Med.*, 177, pp. 1391-1398, (1993)).

[011] Investigators have shown considerable interest in the use of PDE4 inhibitors as anti-inflammatory agents. Early evidence indicates that PDE4 inhibition has beneficial

effects on a variety of inflammatory cells such as monocytes, macrophages, T-cells of the Th-1 lineage, and granulocytes. The synthesis and/or release of many proinflammatory mediators, such as cytokines, lipid mediators, superoxide, and biogenic amines, such as histamine, have been attenuated in these cells by the action of PDE4 inhibitors. The PDE4 inhibitors also affect other cellular functions including T-cell proliferation, granulocyte transmigration in response to chemotoxic substances, and integrity of endothelial cell junctions within the vasculature.

[012] The design, synthesis, and screening of various PDE4 inhibitors have been reported. Methylxanthines, such as caffeine and theophylline, were the first PDE inhibitors discovered, but these compounds are nonselective with respect to which PDE is inhibited. The drug rolipram, an antidepressant agent, was one of the first reported specific PDE4 inhibitors, with a reported IC_{50} of about 200 nM with respect to inhibiting recombinant human PDE4.

[013] Investigators have continued to search for PDE4 inhibitors that are more selective with respect to inhibiting PDE4, that have a lower IC_{50} than rolipram, and that avoid the undesirable central nervous system (CNS) side effects, such as retching, vomiting, and sedation, associated with the administration of rolipram. In addition, several companies are now undertaking clinical trials of other PDE4 inhibitors. However, problems relating to efficacy and adverse side effects, such as emesis and central nervous system disturbances, remain unsolved.

[014] Accordingly, compounds that selectively inhibit PDE4, isoforms PDE4B or PDE4D, or a PDE4 isoform containing a UCR1 activating mutation (such as PDE4B1 containing UCR1 activating mutation S133D, PDE4B1*; or PDE4D7 containing UCR1 activating mutation S54D, PDE4D7*), and, in certain embodiments, that reduce or eliminate the adverse side effects associated with prior PDE4 inhibitors, would be useful in the treatment of disease, including neurologic and psychological diseases, and in the enhancement of memory and cognition. In addition, selective PDE4 inhibitors would be useful in the treatment of diseases that would benefit from elevated cAMP levels or reduced PDE4 function in a particular target tissue.

[0363] As used herein, the terms below have the meanings indicated.

[0364] When ranges of values are disclosed, and the notation “from n_1 ... to n_2 ” or “between n_1 ... and n_2 ” is used, where n_1 and n_2 are the numbers, then unless otherwise specified, this notation is intended to include the numbers themselves and the range between them. This range may be integral or continuous between and including the end values. By way of example, the range “from 2 to 6 carbons” is intended to include two, three, four, five, and six carbons, since carbons come in integer units. Compare, by way of example, the range “from 1 to 3 μ M (micromolar),” which is intended to include 1 μ M, 3 μ M, and everything in between to any number of significant figures (e.g., 1.255 μ M, 2.1 μ M, 2.9999 μ M, etc.). When n is set at 0 in the context of “0 carbon atoms”, it is intended to indicate a bond or null.

[0365] The term “about,” as used herein, is intended to qualify the numerical values which it modifies, denoting such a value as variable within a margin of error. When no particular margin of error, such as a standard deviation to a mean value given in a chart or table of data, is recited, the term “about” should be understood to mean that range which would encompass the recited value and the range which would be included by rounding up or down to that figure as well, taking into account significant figures.

[0366] The term “acyl,” as used herein, alone or in combination, refers to a carbonyl attached to an alkenyl, alkyl, aryl, cycloalkyl, heteroaryl, heterocycle, or any other moiety where the atom attached to the carbonyl is carbon. An “acetyl” group refers to a $-\text{C}(\text{O})\text{CH}_3$ group. An “alkylcarbonyl” or “alkanoyl” group refers to an alkyl group attached to the parent molecular moiety through a carbonyl group. Examples of such groups include methylcarbonyl and ethylcarbonyl. Examples of acyl groups include formyl, alkanoyl and aroyl.

[0367] The term “alkenyl,” as used herein, alone or in combination, refers to a straight-chain or branched-chain hydrocarbon group having one or more double bonds and containing from 2 to 20 carbon atoms. In certain embodiments, said alkenyl will comprise from 2 to 6 carbon atoms. The term “alkenylene” refers to a carbon-carbon double bond system attached at two or more positions such as ethenylene $[(-\text{CH}=\text{CH}-), (-\text{C}::\text{C}-)]$. [0434] Any definition herein may be used in combination with any other definition to describe a composite structural group. By convention, the trailing element of any such definition is that which attaches to the parent moiety. For example, the composite group alkylamido would represent an alkyl group attached to the parent molecule through an amido group, and the term alkoxyalkyl would represent an alkoxy group attached to the parent molecule through an alkyl group.

[0435] When a group is defined to be “null,” what is meant is that said group is absent. When any one or more of G^1 , G^2 , and G^3 of $-(\text{CH}_2)_s\text{G}^1\text{G}^2\text{G}^3$ is designated to be “null”, said group condenses to either a bond if it occupies an interior position (as with G^1 and G^2), or is absent if it occupies a terminal position (as with G^3). Thus, for example, if G^1 and G^3 are both null, then $-(\text{CH}_2)_s\text{G}^1\text{G}^2\text{G}^3$ condenses to $-(\text{CH}_2)_s\text{G}^2$. If G^2 and G^3 are both null, then $-(\text{CH}_2)_s\text{G}^1\text{G}^2\text{G}^3$ condenses to $-(\text{CH}_2)_s\text{G}^1$. Similarly, if G^1 and G^2 are both null, then $-(\text{CH}_2)_s\text{G}^1\text{G}^2\text{G}^3$ condenses to $-(\text{CH}_2)_s\text{G}^3$. When s is designated to be 0, then the $(\text{CH}_2)_s$ portion of $-(\text{CH}_2)_s\text{G}^1\text{G}^2\text{G}^3$ collapses to a bond connecting O to $\text{G}^1\text{G}^2\text{G}^3$. Each of G^1 , G^2 , and G^3 are not meant to be null simultaneously and only two of G^1 , G^2 , and G^3 may be null at once.

[0436] The term “optionally substituted” means the antecedent group may be substituted or unsubstituted. When substituted, the substituents of an “optionally substituted” group may

Two substituents may be joined together to form a fused five-, six-, or seven-membered carbocyclic or heterocyclic ring consisting of zero to three heteroatoms, for example forming methylenedioxy or ethylenedioxy. An optionally substituted group may be unsubstituted (e.g., -CH₂CH₃), fully substituted (e.g., -CF₂CF₃), monosubstituted (e.g., -CH₂CH₂F) or substituted at a level anywhere in-between fully substituted and monosubstituted (e.g., -CH₂CF₃). Where substituents are recited without qualification as to substitution, both substituted and unsubstituted forms are encompassed. Where a substituent is qualified as “substituted,” the substituted form is specifically intended. Additionally, different sets of optional substituents to a particular moiety may be defined as needed; in these cases, the optional substitution will be as defined, often immediately following the phrase, “optionally substituted with.”

[0437] The term R or the term R', appearing by itself and without a number designation, unless otherwise defined, refers to a moiety chosen from hydrogen, alkyl, cycloalkyl, heteroalkyl, aryl, heteroaryl and heterocycloalkyl, any of which may be optionally substituted. Such R and R' groups should be understood to be optionally substituted as defined herein. Whether an R group has a number designation or not, every R group, including R, R' and Rⁿ where n=(1, 2, 3, ...n), every substituent, and every term should be understood to be independent of every other in terms of selection from a group. Should any variable, substituent, or term (e.g. aryl, heterocycle, R, etc.) occur more than one time in a formula or generic structure, its definition at each occurrence is independent of the definition at every other occurrence. Those of skill in the art will further recognize that certain groups may be attached to a parent molecule or may occupy a position in a chain of elements from either end as written. Thus, by way of example only, an unsymmetrical group such as – C(O)N(R)– may be attached to the parent moiety at either the carbon or the nitrogen.

Individual stereoisomers of compounds can be prepared synthetically from commercially available starting materials which contain chiral centers or by preparation of mixtures of enantiomeric products followed by separation such as conversion to a mixture of diastereomers followed by separation or recrystallization, chromatographic techniques, direct separation of enantiomers on chiral chromatographic columns, or any other appropriate method known in the art. Starting compounds of particular stereochemistry are either commercially available or can be made and resolved by techniques known in the art. Additionally, the compounds disclosed herein may exist as geometric isomers. The present invention includes all cis, trans, syn, anti, entgegen (E), and zusammen (Z) isomers as well as the appropriate mixtures thereof. Additionally, compounds may exist as tautomers; all tautomeric isomers are provided by this invention. Additionally, the compounds disclosed herein can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms.

[0439] The term “bond” refers to a covalent linkage between two atoms, or two moieties when the atoms joined by the bond are considered to be part of larger substructure. A bond may be single, double, or triple unless otherwise specified. A combination of a straight and a dashed line parallel between two atoms in a drawing of a molecule indicates that an additional bond may be present or absent at that position; a dashed bond alone, bisected by a wavy line, indicates that the structure depicted is connected to another structure, not shown.

[0440] The term “disease” as used herein is intended to be generally synonymous, and is used interchangeably with, the terms “disorder” and “condition” (as in medical condition), in that all reflect an abnormal condition of the human or animal body or of one of its parts that impairs normal functioning, is typically manifested by distinguishing signs and symptoms, and causes the human or animal to have a reduced duration or quality of life.

[0441] The term “combination therapy” means the administration of two or more therapeutic agents to treat a therapeutic condition or disorder described in the present disclosure. Such administration encompasses co-administration of these therapeutic agents in a substantially simultaneous manner, such as in a single capsule having a fixed ratio of active ingredients or in multiple, separate capsules for each active ingredient. In addition, such

administration also encompasses use of each type of therapeutic agent in a sequential manner. In either case, the treatment regimen will provide beneficial effects of the drug combination in treating the conditions or disorders described herein.

[0442] "PDE4 inhibitor" is used herein to refer to a compound that exhibits an IC_{50} with respect to PDE4 activity of no more than about 100 μM and more typically not more than about 50 μM , as measured in the PDE4 assay described generally hereinbelow. " IC_{50} " is that concentration of inhibitor which reduces the activity of an enzyme (e.g., PDE4) to half-maximal level. Certain representative compounds of the present invention have been discovered to exhibit inhibition against PDE4. In certain embodiments, compounds will exhibit an IC_{50} with respect to PDE4 of no more than about 10 μM ; in further embodiments, compounds will exhibit an IC_{50} with respect to PDE4 of no more than about 5 μM ; in yet further embodiments, compounds will exhibit an IC_{50} with respect to PDE4 of not more than about 1 μM , as measured in the PDE4 assay described herein. In yet further embodiments, compounds will exhibit an IC_{50} with respect to PDE4 of not more than about 200 nM.

[0443] The phrase "therapeutically effective" is intended to qualify the amount of active ingredients used in the treatment of a disease or disorder. This amount will achieve the goal of reducing or eliminating the said disease or disorder.

[0444] The term "therapeutically acceptable" refers to those compounds (or salts, prodrugs, tautomers, zwitterionic forms, etc.) which are suitable for use in contact with the tissues of patients without undue toxicity, irritation, and allergic response, are commensurate with a reasonable benefit/risk ratio, and are effective for their intended use.

[0445] As used herein, reference to "treatment" of a patient is intended to include prophylaxis. The term "patient" means all mammals including humans. Examples of patients include humans, cows, dogs, cats, goats, sheep, pigs, and rabbits. Preferably, the patient is a human.

[0446] The term "prodrug" refers to a compound that is made more active in vivo. Certain compounds disclosed herein may also exist as prodrugs, as described in *Hydrolysis in Drug and Prodrug Metabolism: Chemistry, Biochemistry, and Enzymology* (Testa, Bernard and Mayer, Joachim M. Wiley-VHCA, Zurich, Switzerland 2003). Prodrugs of the compounds described herein are structurally modified forms of the compound that readily undergo chemical changes under physiological conditions to provide the compound. Additionally, prodrugs can be converted to the compound by chemical or biochemical methods in an ex vivo environment. For example, prodrugs can be slowly converted to a compound when placed in a transdermal patch reservoir with a suitable enzyme or chemical

reagent. Prodrugs are often useful because, in some situations, they may be easier to administer than the compound, or parent drug. They may, for instance, be bioavailable by oral administration whereas the parent drug is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug. A wide variety of prodrug derivatives are known in the art, such as those that rely on hydrolytic cleavage or oxidative activation of the prodrug. An example, without limitation, of a prodrug would be a compound which is administered as an ester (the "prodrug"), but then is metabolically hydrolyzed to the carboxylic acid, the active entity. Additional examples include peptidyl derivatives of a compound.

[0447] The compounds disclosed herein can exist as therapeutically acceptable salts. The present invention includes compounds listed above in the form of salts, including acid addition salts. Suitable salts include those formed with both organic and inorganic acids. Such acid addition salts will normally be pharmaceutically acceptable. However, salts of non-pharmaceutically acceptable salts may be of utility in the preparation and purification of the compound in question. Basic addition salts may also be formed and be pharmaceutically acceptable. For a more complete discussion of the preparation and selection of salts, refer to *Pharmaceutical Salts: Properties, Selection, and Use* (Stahl, P. Heinrich. Wiley-VCHA, Zurich, Switzerland, 2002).

[0448] The term "therapeutically acceptable salt," as used herein, represents salts or zwitterionic forms of the compounds disclosed herein which are water or oil-soluble or dispersible and therapeutically acceptable as defined herein. The salts can be prepared during the final isolation and purification of the compounds or separately by reacting the appropriate compound in the form of the free base with a suitable acid. Representative acid addition salts include acetate, adipate, alginate, L-ascorbate, aspartate, benzoate, benzenesulfonate (besylate), bisulfate, butyrate, camphorate, camphorsulfonate, citrate, digluconate, formate, fumarate, gentisate, glutarate, glycerophosphate, glycolate, hemisulfate, heptanoate, hexanoate, hippurate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethansulfonate (isethionate), lactate, maleate, malonate, DL-mandelate, mesitylenesulfonate, methanesulfonate, naphthylenesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphonate, picrate, pivalate, propionate, pyroglutamate, succinate, sulfonate, tartrate, L-tartrate, trichloroacetate, trifluoroacetate, phosphate, glutamate, bicarbonate, para-toluenesulfonate (p-tosylate), and undecanoate. Also, basic groups in the compounds disclosed herein can be quaternized with methyl, ethyl, propyl, and butyl chlorides, bromides, and iodides; dimethyl, diethyl, dibutyl,

and diamyl sulfates; decyl, lauryl, myristyl, and steryl chlorides, bromides, and iodides; and benzyl and phenethyl bromides. Examples of acids which can be employed to form therapeutically acceptable addition salts include inorganic acids such as hydrochloric, hydrobromic, sulfuric, and phosphoric, and organic acids such as oxalic, maleic, succinic, and citric. Salts can also be formed by coordination of the compounds with an alkali metal or alkaline earth ion. Hence, the present invention contemplates sodium, potassium, magnesium, and calcium salts of the compounds disclosed herein, and the like.

[0449] Basic addition salts can be prepared during the final isolation and purification of the compounds by reaction of a carboxy group with a suitable base such as the hydroxide, carbonate, or bicarbonate of a metal cation or with ammonia or an organic primary, secondary, or tertiary amine. The cations of therapeutically acceptable salts include lithium, sodium, potassium, calcium, magnesium, and aluminum, as well as nontoxic quaternary amine cations such as ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, diethylamine, ethylamine, tributylamine, pyridine, *N,N*-dimethylaniline, *N*-methylpiperidine, *N*-methylmorpholine, dicyclohexylamine, procaine, dibenzylamine, *N,N*-dibenzylphenethylamine, 1-phenamine, and *N,N'*-dibenzylethylenediamine. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, and piperazine.

[0450] A salt of a compound can be made by reaction of the appropriate compound, in the form of the free base, with the appropriate acid.

[0451] While it may be possible for the compounds of the subject invention to be administered as the raw chemical, it is also possible to present them as a pharmaceutical formulation (equivalently, a "pharmaceutical composition"). Accordingly, provided herein are pharmaceutical formulations which comprise one or more of certain compounds disclosed herein, or one or more pharmaceutically acceptable salts, esters, prodrugs, amides, or solvates thereof, together with one or more pharmaceutically acceptable carriers thereof and optionally one or more other therapeutic ingredients. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. Proper formulation is dependent upon the route of administration chosen. Any of the well-known techniques, carriers, and excipients may be used as suitable and as understood in the art; *e.g.*, in Remington's Pharmaceutical Sciences. The pharmaceutical compositions disclosed herein may be manufactured in any manner

known in the art, *e.g.*, by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or compression processes.

[0452] The formulations include those suitable for oral, parenteral (including subcutaneous, intradermal, intramuscular, intravenous, intraarticular, and intramedullary), intraperitoneal, transmucosal, transdermal, rectal and topical (including dermal, buccal, sublingual and intraocular) administration although the most suitable route may depend upon for example the condition and disorder of the recipient. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Typically, these methods include the step of bringing into association a compound of the subject invention or a pharmaceutically acceptable salt, ester, amide, prodrug or solvate thereof ("active ingredient") with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation.

[0453] Formulations of the compounds disclosed herein suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

[0454] Pharmaceutical preparations which can be used orally include tablets, push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. Tablets may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with binders, inert diluents, or lubricating, surface active or dispersing agents. Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein. All formulations for oral administration should be in dosages suitable for such administration. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid

paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added. Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

[0455] The compounds may be formulated for parenteral administration by injection, *e.g.*, by bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form, *e.g.*, in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in powder form or in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example, saline or sterile pyrogen-free water, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

[0456] Formulations for parenteral administration include aqueous and non-aqueous (oily) sterile injection solutions of the active compounds which may contain antioxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. Suitable lipophilic solvents or vehicles include fatty oils such as sesame oil, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers or agents which increase the solubility of the compounds to allow for the preparation of highly concentrated solutions.

[0457] In addition to the formulations described previously, the compounds may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

[0458] For buccal or sublingual administration, the compositions may take the form of tablets, lozenges, pastilles, or gels formulated in conventional manner. Such compositions may comprise the active ingredient in a flavored basis such as sucrose and acacia or tragacanth.

[0459] The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, *e.g.*, containing conventional suppository bases such as cocoa butter, polyethylene glycol, or other glycerides.

[0460] Certain compounds disclosed herein may be administered topically, that is by non-systemic administration. This includes the application of a compound disclosed herein externally to the epidermis or the buccal cavity and the instillation of such a compound into the ear, eye and nose, such that the compound does not significantly enter the blood stream. In contrast, systemic administration refers to oral, intravenous, intraperitoneal and intramuscular administration.

[0461] Formulations suitable for topical administration include liquid or semi-liquid preparations suitable for penetration through the skin to the site of inflammation such as gels, liniments, lotions, creams, ointments or pastes, and drops suitable for administration to the eye, ear or nose. The active ingredient for topical administration may comprise, for example, from 0.001% to 10% w/w (by weight) of the formulation. In certain embodiments, the active ingredient may comprise as much as 10% w/w. In other embodiments, it may comprise less than 5% w/w. In certain embodiments, the active ingredient may comprise from 2% w/w to 5% w/w. In other embodiments, it may comprise from 0.1% to 1% w/w of the formulation.

[0462] Topical ophthalmic, otic, and nasal formulations of the present invention may comprise excipients in addition to the active ingredient. Excipients commonly used in such formulations include, but are not limited to, tonicity agents, preservatives, chelating agents, buffering agents, and surfactants. Other excipients comprise solubilizing agents, stabilizing agents, comfort-enhancing agents, polymers, emollients, pH-adjusting agents and/or lubricants. Any of a variety of excipients may be used in formulations of the present invention including water, mixtures of water and water-miscible solvents, such as C1-C7-alkanols, vegetable oils or mineral oils comprising from 0.5 to 5% non-toxic water-soluble polymers, natural products, such as alginates, pectins, tragacanth, karaya gum, guar gum, xanthan gum, carrageenan, agar and acacia, starch derivatives, such as starch acetate and hydroxypropyl starch, and also other synthetic products such as polyvinyl alcohol, polyvinylpyrrolidone, polyvinyl methyl ether, polyethylene oxide, preferably cross-linked polyacrylic acid and mixtures of those products. The concentration of the excipient is,

typically, from 1 to 100,000 times the concentration of the active ingredient. In preferred embodiments, the excipients to be included in the formulations are typically selected on the basis of their inertness towards the active ingredient component of the formulations.

[0463] Relative to ophthalmic, otic, and nasal formulations, suitable tonicity-adjusting agents include, but are not limited to, mannitol, sodium chloride, glycerin, sorbitol and the like. Suitable buffering agents include, but are not limited to, phosphates, borates, acetates and the like. Suitable surfactants include, but are not limited to, ionic and nonionic surfactants (though nonionic surfactants are preferred), RLM 100, POE 20 cetylstearyl ethers such as PROCOL[®] CS20 and poloxamers such as PLURONIC[®] F68.

[0464] The formulations set forth herein may comprise one or more preservatives. Examples of such preservatives include p-hydroxybenzoic acid ester, sodium perborate, sodium chlorite, alcohols such as chlorobutanol, benzyl alcohol or phenyl ethanol, guanidine derivatives such as polyhexamethylene biguanide, sodium perborate, polyquaternium-1, amino alcohols such as AMP-95, or sorbic acid. In certain embodiments, the formulation may be self-preserved so that no preservation agent is required.

[0465] For ophthalmic, otic, or nasal administration, the formulation may be a solution, a suspension, or a gel. In preferred aspects, the formulations are for topical application to the eye, nose, or ear in aqueous solution in the form of drops. The term "aqueous" typically denotes an aqueous formulation wherein the formulation is >50%, more preferably >75% and in particular >90% by weight water. These drops may be delivered from a single dose ampoule which may preferably be sterile and thus render bacteriostatic components of the formulation unnecessary. Alternatively, the drops may be delivered from a multi-dose bottle which may preferably comprise a device which extracts any preservative from the formulation as it is delivered, such devices being known in the art.

[0466] For ophthalmic disorders, components of the invention may be delivered to the eye as a concentrated gel or a similar vehicle, or as dissolvable inserts that are placed beneath the eyelids.

[0467] The formulations of the present invention that are adapted for topical administration to the eye are preferably isotonic, or slightly hypotonic in order to combat any hypertonicity of tears caused by evaporation and/or disease. This may require a tonicity agent to bring the osmolality of the formulation to a level at or near 210-320 milliosmoles per kilogram (mOsm/kg). The formulations of the present invention generally have an osmolality in the range of 220-320 mOsm/kg, and preferably have an osmolality in the range

of 235-300 mOsm/kg. The ophthalmic formulations will generally be formulated as sterile aqueous solutions.

[0468] In certain ophthalmic embodiments, the compositions of the present invention are formulated with one or more tear substitutes. A variety of tear substitutes are known in the art and include, but are not limited to: monomeric polyols, such as, glycerol, propylene glycol, and ethylene glycol; polymeric polyols such as polyethylene glycol; cellulose esters such hydroxypropylmethyl cellulose, carboxy methylcellulose sodium and hydroxy propylcellulose; dextrans such as dextran 70; vinyl polymers, such as polyvinyl alcohol; and carbomers, such as carbomer 934P, carbomer 941, carbomer 940 and carbomer 974P. Certain formulations of the present invention may be used with contact lenses or other ophthalmic products.

[0469] In certain embodiments, formulations are prepared using a buffering system that maintains the formulation at a pH of about 4.5 to a pH of about 8. A most preferred formulation pH is from 7 to 8.

[0470] In certain embodiments, a formulation of the present invention is administered once a day. However, the formulations may also be formulated for administration at any frequency of administration, including once a week, once every 5 days, once every 3 days, once every 2 days, twice a day, three times a day, four times a day, five times a day, six times a day, eight times a day, every hour, or any greater frequency. Such dosing frequency is also maintained for a varying duration of time depending on the therapeutic regimen. The duration of a particular therapeutic regimen may vary from one-time dosing to a regimen that extends for months or years. The formulations are administered at varying dosages, but typical dosages are one to two drops at each administration, or a comparable amount of a gel or other formulation. One of ordinary skill in the art would be familiar with determining a therapeutic regimen for a specific indication.

[0471] Gels for topical or transdermal administration may comprise, generally, a mixture of volatile solvents, nonvolatile solvents, and water. In certain embodiments, the volatile solvent component of the buffered solvent system may include lower (C1-C6) alkyl alcohols, lower alkyl glycols and lower glycol polymers. In further embodiments, the volatile solvent is ethanol. The volatile solvent component is thought to act as a penetration enhancer, while also producing a cooling effect on the skin as it evaporates. The nonvolatile solvent portion of the buffered solvent system is selected from lower alkylene glycols and lower glycol polymers. In certain embodiments, propylene glycol is used. The nonvolatile solvent slows the evaporation of the volatile solvent and reduces the vapor pressure of the buffered solvent

system. The amount of this nonvolatile solvent component, as with the volatile solvent, is determined by the pharmaceutical compound or drug being used. When too little of the nonvolatile solvent is in the system, the pharmaceutical compound may crystallize due to evaporation of volatile solvent, while an excess may result in a lack of bioavailability due to poor release of drug from solvent mixture. The buffer component of the buffered solvent system may be selected from any buffer commonly used in the art; in certain embodiments, water is used. A common ratio of ingredients is about 20% of the nonvolatile solvent, about 40% of the volatile solvent, and about 40% water. There are several optional ingredients which can be added to the topical composition. These include, but are not limited to, chelators and gelling agents. Appropriate gelling agents can include, but are not limited to, semisynthetic cellulose derivatives (such as hydroxypropylmethylcellulose) and synthetic polymers, galactomannan polymers (such as guar and derivatives thereof), and cosmetic agents.

[0472] Lotions include those suitable for application to the skin or eye. An eye lotion may comprise a sterile aqueous solution optionally containing a bactericide and may be prepared by methods similar to those for the preparation of drops. Lotions or liniments for application to the skin may also include an agent to hasten drying and to cool the skin, such as an alcohol or acetone, and/or a moisturizer such as glycerol or an oil such as castor oil or arachis oil.

[0473] Creams, ointments or pastes are semi-solid formulations of the active ingredient for external application. They may be made by mixing the active ingredient in finely-divided or powdered form, alone or in solution or suspension in an aqueous or non-aqueous fluid, with the aid of suitable machinery, with a greasy or non-greasy base. The base may comprise hydrocarbons such as hard, soft or liquid paraffin, glycerol, beeswax, a metallic soap; a mucilage; an oil of natural origin such as almond, corn, arachis, castor or olive oil; wool fat or its derivatives or a fatty acid such as steric or oleic acid together with an alcohol such as propylene glycol or a macrogel. The formulation may incorporate any suitable surface active agent such as an anionic, cationic or non-ionic surfactant such as a sorbitan ester or a polyoxyethylene derivative thereof. Suspending agents such as natural gums, cellulose derivatives or inorganic materials such as siliceous silicas, and other ingredients such as lanolin, may also be included.

[0474] Drops may comprise sterile aqueous or oily solutions or suspensions and may be prepared by dissolving the active ingredient in a suitable aqueous solution of a bactericidal and/or fungicidal agent and/or any other suitable preservative, and, in certain embodiments,

including a surface active agent. The resulting solution may then be clarified by filtration, transferred to a suitable container which is then sealed and sterilized by autoclaving or maintaining at 98-100°C for half an hour. Alternatively, the solution may be sterilized by filtration and transferred to the container by an aseptic technique. Examples of bactericidal and fungicidal agents suitable for inclusion in the drops are phenylmercuric nitrate or acetate (0.002%), benzalkonium chloride (0.01%) and chlorhexidine acetate (0.01%). Suitable solvents for the preparation of an oily solution include glycerol, diluted alcohol and propylene glycol.

[0475] Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavored basis such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a basis such as gelatin and glycerin or sucrose and acacia.

[0476] For administration by inhalation, compounds may be conveniently delivered from an insufflator, nebulizer pressurized packs or other convenient means of delivering an aerosol spray. Pressurized packs may comprise a suitable propellant such as dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. Alternatively, for administration by inhalation or insufflation, the compounds according to the invention may take the form of a dry powder composition, for example a powder mix of the compound and a suitable powder base such as lactose or starch. The powder composition may be presented in unit dosage form, in for example, capsules, cartridges, gelatin or blister packs from which the powder may be administered with the aid of an inhalator or insufflator.

[0477] Preferred unit dosage formulations are those containing an effective dose, as herein below recited, or an appropriate fraction thereof, of the active ingredient.

[0478] It should be understood that in addition to the ingredients particularly mentioned above, the formulations described above may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

[0479] Compounds may be administered orally or via injection at a dose of from 0.1 to 500 mg/kg per day. The dose range for adult humans is generally from 5 mg to 2 g/day. Tablets or other forms of presentation provided in discrete units may conveniently contain an amount of one or more compounds which is effective at such dosage or as a multiple of the same, for instance, units containing 5 mg to 500 mg, usually around 10 mg to 200 mg.

[0480] The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration.

[0481] The compounds can be administered in various modes, *e.g.* orally, topically, or by injection. The precise amount of compound administered to a patient will be the responsibility of the attendant physician. The specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diets, time of administration, route of administration, rate of excretion, drug combination, the precise disorder being treated, and the severity of the indication or condition being treated. Also, the route of administration may vary depending on the condition and its severity.

[0482] In certain instances, it may be appropriate to administer at least one of the compounds described herein (or a pharmaceutically acceptable salt, ester, or prodrug thereof) in combination with another therapeutic agent. By way of example only, if one of the side effects experienced by a patient upon receiving one of the compounds herein is hypertension, then it may be appropriate to administer an anti-hypertensive agent in combination with the initial therapeutic agent. Or, by way of example only, the therapeutic effectiveness of one of the compounds described herein may be enhanced by administration of an adjuvant (*i.e.*, by itself the adjuvant may only have minimal therapeutic benefit, but in combination with another therapeutic agent, the overall therapeutic benefit to the patient is enhanced). Or, by way of example only, the benefit of experienced by a patient may be increased by administering one of the compounds described herein with another therapeutic agent (which also includes a therapeutic regimen) that also has therapeutic benefit. By way of example only, in a treatment for diabetes involving administration of one of the compounds described herein, increased therapeutic benefit may result by also providing the patient with another therapeutic agent for diabetes. In any case, regardless of the disease, disorder or condition being treated, the overall benefit experienced by the patient may simply be additive of the two therapeutic agents or the patient may experience a synergistic benefit.

[0483] Specific, non-limiting examples of possible combination therapies include use of the compounds of the invention with anti-nausea medications (for example, ondansetron), antidepressants, nootropics, anti-acetylcholinesterases, N-methyl D-aspartate (NMDA) receptor antagonists, amyloid beta therapeutics, and tau therapeutics, neurotrophic growth factors, cell based therapies and other regenerative medicine therapies for treatment of

A-beta therapies include β -secretase inhibitors, γ -secretase inhibitors, $A\beta_{42}$ -lowering agents (e.g. tarenflurbil), anti-aggregation agents (e.g. apomorphine), antibodies and other immunotherapies. Tau therapies include Tau phosphorylation inhibitors, tau fibrillization inhibitors, and tau degradation enhancers.

[0487] In any case, the multiple therapeutic agents (at least one of which is a compound disclosed herein) may be administered in any order or even simultaneously. If simultaneously, the multiple therapeutic agents may be provided in a single, unified form, or in multiple forms (by way of example only, either as a single pill or as two separate pills). One of the therapeutic agents may be given in multiple doses, or both may be given as multiple doses. If not simultaneous, the timing between the multiple doses may be any duration of time ranging from a few minutes to four weeks.

In a related aspect, the present invention provides therapeutic compositions comprising at least one compound of the present invention in combination with one or more additional agents for the treatment of PDE4-mediated disorders.

[0489] The compounds of the subject invention may also be useful for the treatment of certain diseases and disorders of the nervous system. Central nervous system disorders in which PDE4 inhibition may be useful include cortical dementias including Alzheimer's disease, AIDS-related dementia (HIV dementia), and mild cognitive impairment (MCI). MW = 467.93. ¹H NMR (400 MHz, methanol-d₄) δ 8.34 (s, 1H), 8.25 (d, J = 7.6 Hz, 1H), 7.60 (d, J = 8.0 Hz, 2H), 7.49 (m, 2H), 7.39 (d, J = 8.0 Hz, 2H), 3.61 (t, J = 4.8 Hz, 2H), 3.56 (s, 2H), 3.13 (t, J = 6.4 Hz, 2H), 2.54 (m, 2H).

EXAMPLE 316**2-(3-Chlorophenyl)-5,5-dioxo-N-[4-(2H-tetrazol-5-ylmethyl)phenyl]-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-amine**

Step 1: [2-(3-Chlorophenyl)-5,5-dioxo-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-yl] trifluoromethanesulfonate

[01062] A 25-mL round bottomed flask was charged with [2-(3-Chlorophenyl)-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-yl] trifluoromethanesulfonate (200 mg, 0.487 mmol, 1 eq.), 3-chloroperbenzoic acid (450 mg, 2 mmol, 4 eq.) and dichloromethane (10 ml). The resulting mixture was stirred at room temperature until the starting sulfide was consumed. The mixture was then poured into sodium bicarbonate solution (20 ml). The organic layer was separated and washed with sodium bicarbonate solution (10 ml). After drying over Na₂SO₄, solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel using dichloromethane/hexane (1:1, 1.5:1, and 2:1) as eluent to give the title compound as a white solid (137 mg, 64% yield).

Step 2: 2-[4-[[2-(3-Chlorophenyl)-5,5-dioxo-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-yl]amino]phenyl]acetonitrile

[01063] An 8-mL vial was charged with 2-(4-aminophenyl)acetonitrile (30 mg, 0.23 mmol, 2 eq.), [2-(3-Chlorophenyl)-5,5-dioxo-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-yl] trifluoromethanesulfonate (50 mg, 0.112 mmol, 1. eq.) and DMF (0.5 ml). The resulting mixture was stirred at 70 °C overnight. After cooling to room temperature, water was added to the mixture (5 ml). The precipitate was collected by filtration and washed with water (10 ml). After drying, the crude product was purified by chromatography on silica gel using dichloromethane as eluent to give the title compound (18 mg, 38% yield).

Step 3: 2-(3-Chlorophenyl)-5,5-dioxo-N-[4-(2H-tetrazol-5-ylmethyl)phenyl]-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-amine

[01064] A 8-mL vial was charged with 2-[4-[[2-(3-Chlorophenyl)-5,5-dioxo-7,8-dihydro-6H-thiopyrano[3,2-d]pyrimidin-4-yl]amino]phenyl]acetone nitrile (17 mg, 0.04 mmol, 1 eq.), azido(trimethyl)silane (0.2 ml, excess) and tetrabutylammonium fluoride hydrate (50 mg, 0.19 mmol, 4.6 eq.). The mixture was stirred at 110 °C overnight. After cooling to room temperature, the mixture was partitioned between dichloromethane (8 ml) and 2N HCl (4 ml). The organic layer was separated and washed with sodium bicarbonate solution (5 ml) and dried over Na₂SO₄. Removal of solvent under reduced pressure gave a residue, which was purified using a preparation TLC plate and 3% of methanol in dichloromethane as mobile to give the title compound as white solid (13 mg, 70% yield). MW = 467.93. ¹H NMR (400 MHz, methanol-d₄) δ 8.32 (s, 1H), 8.24 (d, J = 7.2 Hz, 1H), 7.67 (d, J = 8.4 Hz, 2H), 7.46 (m, 2H), 7.38 (d, J = 8.4 Hz, 2H), 4.38 (s, 2H), 3.63 (d, J = 5.6 Hz, 2H), 3.14 (d, J = 6.4 Hz, 2H), 2.54 (m, 2H).

EXAMPLE 317

2-(5-chloro-2-thienyl)-5-ethyl-6-methyl-N-[4-(methylsulfonylmethyl)phenyl]pyrimidin-4-amine

[01065] The title compound was prepared in a similar manner to those described herein, with modifications within the skill of one skilled in the art (5.6 mg, 13% yield). MW = 421.96. ¹H NMR (400 MHz, CDCl₃) δ 7.80 (d, J = 8.8 Hz, 2H), 7.68 (d, J = 4.0 Hz, 1H), 7.46 (d, J = 8.8 Hz, 2H), 6.94 (d, J = 4.0 Hz, 1H), 6.61 (s, 1H), 4.28 (s, 2H), 2.82 (s, 3H), 2.66 (q, J = 7.2 Hz, 2H), 2.51 (s, 3H), 1.26 (t, J = 7.2 Hz, 3H).

[01066] The following compounds may be synthesized using methods analogous to those described herein and known in the art, using appropriate starting materials. These compounds may not yet have been made or tested:

Biological Assays

[01067] The activity of many of the compounds in Examples 1-41 and 43-317 as PDE4 inhibitors is illustrated in the following assay. Certain compounds listed above, which have not yet been made and/or tested, are predicted to have activity in this assay as well.

Kinetic assay of PDE4 activity

[01068] PDE4 activity may be measured by any method known in the art. Here, a kinetic assay of cAMP hydrolysis by purified PDE4 was used, in which PDE4 activity was measured by coupling the formation of the PDE4 reaction product, 5'-adenosine monophosphate, to the oxidation of reduced nicotinamide adenine dinucleotide (NADH) by the use of three coupling enzymes (myokinase, pyruvate kinase and lactate dehydrogenase), which allows fluorescent determination of reaction rates. Assays are performed in 96-well plates in a total volume of 200 μ l/well. Compounds are dissolved in dimethylsulfoxide (DMSO) and added to plates in a volume of 10 μ l followed by addition of 165 μ l of assay mix. Plates are pre-incubated at 25 $^{\circ}$ C for 15 min and the reactions are initiated by the addition of 25 μ l of cAMP followed by thorough mixing. Reaction rates are measured by monitoring the decrease in fluorescence using excitation at 355 nm and emission at 460 nm for a period of 10 min in a fluorescence plate reader. Initial rates (slopes) are determined from linear portions of the progress curves.

Final concentrations of assay components are as follows: 50 mM Tris, pH 8, 10 mM MgCl₂, 50 mM KCl, 2% DMSO, 5 mM tris(2-carboxyethyl)phosphine (TCEP), 0.4 mM phosphoenolpyruvate (PEP), 0.01 mM NADH, 0.04 mM adenosine triphosphate (ATP), 0.004 mM cAMP, 7.5 units myokinase from yeast, 1.6 units pyruvate kinase, 2 units lactate dehydrogenase, and either 0.5 nM human PDE4D7 or 10 nM human PDE4B1. All data are percent normalized relative to controls and are presented as percent inhibition. An inhibitory concentration 50% (IC₅₀) value is calculated by fitting of a sigmoidal dose response curve. Human PDE4D7 contained a mutation of serine 54 to aspartic acid to mimic activation by cAMP-dependent protein kinase A (PKA). Human PDE4B1 contained a corresponding mutation of serine 133 to aspartic acid to also mimic PKA activation. These methods were adapted from Burgin, A.B. et al., "Design of Phosphodiesterase Type 4D (PDE4D) Allosteric Modulators for Cognition with Improved Safety," *Nature Biotechnology* **28**, 63-70 (2010).

[01069] Results are shown below in Table 1, in which + indicates < 1 μ M and - indicates > 1 μ M. A – does not mean that the compound is undesirable. "ND" indicates no data; these compounds may not yet have been tested. It is expected that these compounds when tested will be active and will have utility similar to those that have been tested ("NT"). Also, the asterisk (*) indicates that the PDE4 isoform contains a UCR1 activating mutation: PDE4B1* = PDE4B1 containing a UCR1 activating mutation S133D. PDE4D7* = PDE4D7 containing a UCR1 activating mutation S54D.

[01070] Table 2 shows the selectivity of certain compounds disclosed herein. In Table 2, + indicates a selectivity of the given ratio of isoforms of > 10x, and – indicates a selectivity of ≤ 10x. A – does not mean that the compound is undesirable. “ND” indicates no data; these compounds may not yet have been tested. It is expected that these compounds when tested will be active and will have utility similar to those that have been tested. PDE4D7* = PDE4D7 containing a UCR1 activating mutation S54D.

In Vivo Assays

[01071] PDE4 inhibitors may be shown to be effective in an animal model of depression (such as forced swimming test) and animal models of memory (such as maze test and novel object recognition test). See Saccomano, N. A. et al., *J. Med. Chem.* 34, p 291-298, 1991; O'Donnell, J. M. and Zhang, H. T., *Trends Pharmacol. Sci.*, 25, p 158-163 (2004; Zhang, H. T. and O'Donnell, J. M., *Psychopharmacology*, 150, p 311-316, 2000. Since these improvements are hypothesized to be caused by activation of the central nerve system as a result of increase of the intracellular cAMP level, compounds disclosed herein are expected to be effective in diseases that are improved by activation of the central nervous system. Examples of such diseases include depression, anxiety, degradation of learning and memory ability, Alzheimer's disease, arteriosclerotic dementia, Parkinson's disease, Huntington's disease and late motor disorders.

Depression

[01072] The forced-swim test (FST) is the most widely used test of antidepressant drug action. In the FST, a rat is placed in an inescapable cylinder of water. (See Krishnan V and Nestler EJ, "Animal models of depression: molecular perspectives," *Current topics in behavioral neurosciences* 2011;7:121-47; and Bergner CL et al., "Mouse models for studying depression-like states and antidepressant drugs," *Methods Mol Biol* 2010;602:267-82.) This causes stress to the animal and following an initial period of swimming and climbing, the rat eventually displays a floating or immobile posture. The rat is removed from the water after 15 minutes. Immobility has been interpreted as an expression of behavioral despair or entrapment and is reversed by the single dose administration of almost all available antidepressants.

[01073] Intact, adult male or female rats are used for the FST. Either outbred or inbred strains of rats may be used for the study. The rats are group housed and allowed to acclimate for 7 days after arrival. All rats will be housed on standard bedding, kept under a reversed 12:12 hr light:dark (lights on ~6 pm:6 am), and will receive food and water ad lib.

[01074] Comparison is made between a group of 10 rats that is dosed with vehicle only versus groups of 10 rats that are dosed with varying amounts of the test compound. Typically, test compounds are dosed at 0.1, 0.3, 1, 3, and 10 mg/kg by oral gavage. The dosing volume will be 10 ml/Kg for PO. The vehicle for dosing will be chosen based on the solubility of the compound. For oral dosing, the compound may be dosed in solution or may be dosed in suspension depending upon solubility. PO dosing is performed by oral gavage while the rat is restrained by hand using a flexible tube appropriate for rat.

[01075] For the FST, rats are placed in a cylindrical 5 gallon tank so the animals can swim or float without touching the bottom with their tails. The test is recorded via video camera for analysis offline or scored in real time by an observer. Behavior is scored by categorizing behavior as active escape (swimming, climbing), passive (floating immobile) or neutral (quiet paddling or grooming behaviors). For each rat, onset to the first 5 second bout of immobility, the number of bouts of immobility, and total time spent immobile is recorded. Immobility may be compared during the first 5 min of the FST or during the last 5 min of the FST. Comparison of data between groups is by ANOVA.

[01076] Compounds disclosed herein are expected to demonstrate activity in the models disclosed above, and to have utility in the treatment of diseases disclosed herein, including disorders of the central nervous system, psychological disorders, and disorders of cognition.

Cognition and Memory

[01077] PDE4 inhibitors, for example PDE4D inhibitors, are expected to have utility as memory enhancers and cognitive adjuvants. One test for the efficacy of compounds disclosed herein may be carried out as described by Li, YF et al., "Phosphodiesterase-4D knock-out and RNA interference-mediated knock-down enhance memory and increase hippocampal neurogenesis via increased cAMP signaling," *J Neurosci.* 2011 January 5; 31(1): 172–183.

[01078] Compounds disclosed herein are expected to demonstrate activity in the models disclosed above, and to have utility in the treatment of diseases disclosed herein, including disorders of the central nervous system, psychological disorders, and disorders of cognition.

Solubility Protocol

[01079] To measure compound solubility in aqueous buffer, about 5 mg of a compound may be mixed with 500 μ L of pH 7.4, 0.1 M sodium phosphate buffer. The mixture is adjusted to the original pH of 7.4 and then mixed overnight or longer via rotary mixing. The sample is checked for pH and then filtered through a 0.45 μ m filter. If the pH drifted away, the sample is adjusted to its original pH and mixed for at least 15 minutes before filtration. The filtrate is analyzed using HPLC. Generally, solubility ≥ 1 mg/mL is considered to be better than solubility of < 1 mg/mL, as it is generally easier to formulate for oral delivery. Certain compounds disclosed herein are expected to have solubility of ≥ 1 mg/mL. However, ideal solubility may vary; for example, an aqueous formulation may benefit from an even

higher solubility. Conversely, a formulation containing hydrophilic carriers and one or more surfactants may be used to deliver a compound of low aqueous solubility.

Stability Protocol

[01080] To provide a measure of compound stability, about 3 mg of a compound may be dissolved in 3 mL of acetonitrile/water mixture (50/50). 100 μ L of the stock solution is added to 20 mL each of 0.025 M pH 5.0 sodium acetate buffer (A5.0), 0.025 M pH 5.0 citrate buffer (C5.0) and 0.025 M pH 7.4 sodium phosphate buffer (P7.4). A two mL aliquot of each solution is kept in a glass vial equipped a cap lined with Teflon. Two vials containing the solution may be stored at 4°C or -20°C as control. Other aliquots may be stressed at RT, 45°C or 75°C for specified time check points, e.g. 1 day, 1 week, 2 weeks, 4 weeks, 8 weeks, or 12 weeks. The stressed samples in duplicate are assayed against the control using HPLC. The results are reported in % degradation. Preliminary shelf life (T90) is estimated assuming the rate of chemical degradation is double when the temperature is up 10 °C.

[01081] It is expected that certain compounds disclosed herein, when tested, will be sufficiently shelf-stable.

[01082] From the foregoing description, one skilled in the art can easily ascertain the essential characteristics of this invention, and without departing from the spirit and scope thereof, can make various changes and modifications of the invention to adapt it to various usages and conditions.
